Reliable Reporting

EURUS RESOURCE CORP. (ERR-V)

THIOS RESOURCES INC. (THI-V)

ROCK & ROLL ASSAYS PENDING - Eurus Resource Corp. and Thios Resources Inc. expect to receive assays in the next few days from a drilling program carried out on the Rock & Roll project located 10 km northwest of the SNIP mine in the Iskut River area of northwest B.C. SEE MAP OVERLEAF PAGE 1. The companies can jointly earn a 100% interest by spending \$1,000,000 by 5Mar95 and may also jointly pay \$500,000 to PRIME RESOURCES GROUP INC. (PRU-V) by 13Mar95, subject to a 1% net smelter return royalty. A \$1,500,000 program is underway to evaluate a polymetallic volcanogenic massive sulphide zone discovered last year. Drilling resumed Jan.13 with closely-spaced holes testing the Black Dog horizon, a stratigraphic unit hosting several zones of base metal sulphide mineralization. To Feb.12, the 28 drill holes have been completed totalling 3,250 meters. The property being drilled roughly 100 - 200 meters above sea level.

The Rock & Roll property is comprised of 21 claims totalling 351 units covering 8,000 hectares roughly bisected by the Iskut River. A total of 19 chip samples taken of exposed base metal sulphide mineralization in three hand trenches returned assays ranging from 0.054 to 0.344 oz. gold /ton and 4.54 to 150.0 oz. silver /ton respectively, and up to 8.99% lead, 23% zinc and 2.42% copper over widths ranging from 0.8 to 5.2 feet. Eurus and Thios followed the trenching with a nine-hole drilling program last September; see results below:

RR90-9	11.24-12.07	2.7	.013	1.09	.20	1.08	.21
	17.00-22.00	16.4	.013	.60	.03	1.01	.32

All the above holes encountered one or more base metal sulphide-bearing intercepts, although hole-to-hole correlation of these zones is not well understood as yet. Concurrent with the drilling, Eurus and Thios increased their land position from two to 21 claims by staking. The Bornagain property, adjoining to the east, was acquired and is now a joint venture among Eurus (37.5%), Thios (37.5%) and CONSOLIDATED BEL-AIR RESOURCES LTD. (CBT-V) (25%).

Linecutting, geophysical and geochemical surveys

have been expanded to cover most of the eastern portion of the Rock & Roll property and all of the southern half of the Bornagain ground. The ground geophysics traced the Black Dog horizon in a NW-SE direction over at least 1,300 meters, confirming the airborne survey results. Recognition of the volcanogenic nature of the Black Dog mineralization prompted a shift from exploring for a SNIP-type precious metals rich shear zone model to a stratabound massive sulphide model. The other nearby target of a similar nature is the polymetallic massive sulphide deposit at Eskay Creek 30 miles to the east. (SEE GCNL No.23, 1Feb90, P.1 FOR PREVIOUS DATA)
