VARITECH RESOURCES LTD. (VAR-V)

LAKEWATER DRILLING RESULTS - William Campbell, secretary,
Tymar Resources Inc.,

reports assay results from 10 diamond drill holes have been received from the Lakewater property located five km southwest of the Eskay Creek deposit, which is about 60 miles northwest of Stewart, B.C. The project is an equal joint venture between Tymar, the operator, Akiko-Lori Gold Resources Ltd. and Varitech Resources Ltd. Six drill holes were completed on the North SIB claim gap and four on the South SIB claim gap. Of the four holes on the South, LW91-17 and 19 were targeted to intersect the interpreted extension of the Lulu mudstone horizon on the American Fibre/Silver Butte SIB property. Both holes intersected andesite dyking where the Lulu mudstone is projected to cross the South SIB claim gap.

Drill holes LW91-21 to 24 were drilled to test the stratigraphic extent of mineralization intersected in hole LW90-2 on Section 14+25S and LW90-8 on Section 14+10S. Hole LW91-23 on Section 16+00S, about 200 meters southwest of LW90-2, returned 0.055 oz.gold/ton and 2.36 oz.silver/ton over 9.8 feet. Hole 91-24 on Section 13+50S, about 50 meters north of LW90-8, returned 0.022 oz.gold/ton, 1.55 oz.silver/ton, 3.13% lead, 5.15% zinc and 0.70% copper over 6.6 feet. Their were no significant results from the remaining holes.

To date, only a small portion of the property has been drill tested. All of the holes have been collared in stratigraphy correlated to the footwall of the Eskay Creek 21 Zone deposits. A planned Phase III program will focus on many of the other untested geological and geophysical targets existing on the property, including the postulated southwest extension of the hosting stratigraphy of the Eskay Creek 21B deposit.
