DAVID/LEW DRILL RESULTS - Dagoon Resources Ltd. and 50/

50 joint venture partner Greenstone Resources Ltd. have completed the four hole drill program on the David/Lew project located 20 miles southwest of Cranbrook, B.C.

The northeast-trending series of five parallel shear zones have been traced to date for a length of 1.8 miles. Work has been concentrated on two zones over a strike length of 2,500 feet. The latest four holes extended the mineralized zone to a depth of 625 feet returning dispersed gold values over an average width of 10 feet. Drill hole 91-61 returned the best values with 0.11 oz.gold/ton over 2.6 feet. Additional drilling is required to fully evaluate the zone.

A geochemical program carried out on two strong parallel zones at the north end of the grid, which is still open along strike, returned values to 0.60 oz. gold /ton from grab samples. A trenching program is expected to begin shortly to better define drill targets. A geochemical program is planned for the remaining parallel shear zones. (SEE GCNL No.40, 26Feb91, P.1 FOR PREVIOUS DRILL RESULTS)
