Reliable Reporting

REA GOLD CORP. (REO-V,T; REOGF-Nasdaq)

GOLD DISCOVERED ON CENTRAL ZONE - Larry Reaugh, president, reports Rea Gold has intersected gold mineralization on the central zone at the Samatosum mine, 60 miles north of Kamloops, B.C., a joint venture between MINNOVA INC. (MVA-T,M), the operator, and Rea Gold, which has a 30% interest and a 5% net smelter return royalty.

Assays from diamond drill hole RG-398, on the north side of Johnson Creek, returned results below. The hole was drilled on Section 120+00W at 800 meters north, dip -55°, azimuth 225°, depth 374.8 meters.

HOLE	INTERVAL	LENGTH	GOLD	GOLD
<u>NO.</u>	<u>METERS</u>	<u>METERS</u>	<u>OZ/T</u>	<u>GR/T</u>
RG398	156.3 - 158.4	2.1	1.17	40.03 (uncut)
	156.3 - 158.4	2.1	0.20	6.89 (cut)
Incl.	156.9 - 157.3	.4	6,076	208.31 (uncut)
	232.9 - 233.4	.5	.17	5.90 (uncut)
	235.3 - 240.2	4.9	.16	5.36 (uncut)

Visible coarse gold was intersected in milky-white quartz carbonate veins within the highly deformed Samatosum sedimentary unit which lies between the known mineralized horizons. The mineralized veins appear to be part of a swarm that has been subjected to folding along with the host rock. Drilling to test the extent of the new find includes hole RG400, up-dip of RG398, RG401, 100 meters northwest of RG398 and RG402, 100 meters southwest of RG398. Assays of these holes are pending. The total metallics method of analysis is used where the quartz/carbonate veins are present. (SEE GCNL No.68, 9Apr91, P.1 FOR PREVIOUS DRILLING RESULTS)
