## DASSERAT DEVELOPMENTS CORP. (DSD-V)

**MINERALIZATION DISCOVERED** - David Cook, P.Eng., director, reports Dasserat Developments has discovered mineralization in its Phase I exploration program on the MM 1-5 claims located between Kookaburra Resources' Col property and the Digger Resources/BP joint venture, immediately north of Chuchi Lake and 32 km NW of the Mt. Milligan deposits. Dasserat can earn a 100% interest by paying \$140,000 over five years, issuing 25,000 shares in the 5th and 6th years plus paying a net smelter return starting in 1996 of 2.5% or \$30,000, whichever is greater.

An intensely altered zone at least one km in diameter was found which is still being defined by prospecting. The original unaltered rocks are thought to have been units of the Witch Lake Formation (Takla Group) as the peripheral unaltered rocks are of this formation. This zone is considered to be an alteration halo associated with a granitoid stock, as sub-outcrop of a granitoid rock has been reported from this field within the halo. Marginal to this alteration zone, certain beds of the Witch Lake Formation have been preferentially altered and intensely veined. Chalcopyrite has been identified in hand specimens from this bed. A major fault of sheared rock 20 meters wide defines the east boundary of the alteration halo as at Mt. Milligan. Over 400 rock and soil samples are

presently being taken over the showings and the alteration halo with results due mid-July. (SEE GCNL No.85, 2May91, P.5 FOR PREVIOUS INFORMATION)
