## CANDELA RESOURCES LTD. (CDD-V)

SWAN DRILLING TO START - William Campbell, secretary, reports Candela Resources Ltd. plans to start drilling the Swan property within 10 days. The project is located about 20 miles east of Takla Landing in central B.C. and 55 miles northwest of Placer Dome's Mt. Milligan deposits. Candela can earn a 60% interest from EASTFIELD RESOURCES LTD. (ETF-V) by paying \$300,000 over four years, spending \$3,000,000 on exploration over five years and issuing 100,000 shares, subject to a 2% net smelter return royalty to original vendor William Halleran. Field crews are currently preparing access roads and drill sites.

The property is underlain by porphyry-style alteration and copper mineralization hosted in alkalic intrusions. Drilling by several groups in the 1960's and '70's indicated a geological reserve of 36,000,000 tons grading 0.2% copper. Gold assays were not done at that time; however, Eastfield sampling in 1989 returned anomalous gold values up to 0.03 oz/ton. Geophysical surveying in 1989 indicated the known mineralization is associated with induced polarization anomalies which extend north and west of the mineralization. These areas will be drill tested in the current program. (SEE GCNL No.73, 16Apr91, P.3 FOR PREVIOUS INFORMATION)
