METLA RECON ASSAYS - Murray Pezim, chairman, reports Galico Resources Inc. has received preliminary assays for initial reconnaissance samples on the Metla property, located about 40 km northwest of Telegraph Creek, B.C. ADRIAN RESOURCES LTD. (ADL-V) can earn a 50% from Galico. The results above are for 22 of 33 grab samples returning over 0.10 oz.gold/ton. Previous work by Cominco identified six showings of gold, silver and base metal mineralization covering an area about 5,500 feet long by 900 feet wide. The assays above represent mineralized surface rubble, boulders and outcrop. Mineralization is associated with stratabound sulphide zones in volcanic and sedimentary rocks. No work has yet been done on the D and F showings. Preliminary results from an airborne geophysical surveys have been received. The Metla anomalies are one of several clusters of electromagnetic anomalies now recognized to be restricted to a well-defined geophysical zone trending across the width of the property. Geophysical/geological surveys are nearly completed with diamond drilling to start as soon as possible. (SEE GCNL No.117, 18Jun91, P.2 FOR PREVIOUS PROJECT INFORMATION)
