	826.2-837.0	10.8	.315	Canarc Resource Corp.
	902.0-923.7	21.7	.595	and Suntac Minerals
	910.5-923.7	13.2	.861	Corp. have received
PC-91-2	864.0-878.2	14.2	.839	assays from the first

 two holes of the 1991 program at the Polaris-Taku mine on the Tulsequah River, 60 km east of Juneau, Alaska. SEE CROSS-SECTION OVERLEAF

P.1. Suntac has an option to earn a 60% interest in the property from REMBRANDT GOLD MINES LTD. (RTG-Alberta) by spending \$3,000,000 and completing a feasibility study by 1Aug93. Canarc may acquire 37% interest in Suntac's share, or 51% on a fully-diluted basis.

Drill holes PC-91-1 and 2 were targeted to intersect the C vein at depths of 700 to 800 feet downdip from hole PC-90-4, which intersected 0.465 oz. gold/ton over 13.1 feet, and along strike from hole PC-90-2 which encountered 0.58 oz. gold/ton over 13.2 feet. These holes indicate a continuation of the high grade ore shoot extending from surface through the 300, 450 and 600 underground levels in the mine down to more than 800 feet. The goal of the drilling program is to increase contained gold reserves from 720,000 to over 1,000,000 ounces. The ore shoot in the C vein is open at depth and to the east, where drilling is underway. (SEE GCNL No.123, 26Jun91, P.2 FOR PREVIOUS DATA)
