ANOMALOUS GOLD DISCOVERED - Byard H. MacLean, president, reports Major General Resources and 50/50 joint venture partner Varitech Resources have received results of a reconnaissance stream sampling program on the Osi project 200 miles northwest of Fort St. James, B.C. just east of the BP CAI property. Heavy mineral concentrate, HMC samples (non-magnetic/-80 mesh fraction) ranged from 0.12 to 0.76 oz.gold/ton. Total sample (-80 mesh fraction) returned grades ranging from 0.03 to 0.42 oz.gold/ton. Heavy mineral concentrate assays over 0.03 oz.gold/ton are considered anomalous and warrant follow-up. The results indicate a local gold source associated with a magnetic anomaly located in the centre of the property.
