	8,000,000	1.55	1.22	6.81	.08	3.19

-----  
**NEW TULSEQUAH CHIEF RESERVES** - John A. Greig, president, reports Redfern Resources Ltd., 40%, and operator Cominco, 60%, have calculated a new geologically inferred reserve for the Tulsequah Chief deposit located in northwest B.C. about 40 miles east of Juneau, Alaska. The AB lens reserve is based on 13 drill intercepts and the H lens reserve is based on nine drill intercepts. The area of influence around each hole averages about 200 feet. A weighted average specific gravity of 8.48 cubic feet per ton (3.78 gms/cc) used in the calculations was based on individual specific gravity measurements of core from 17 holes and estimated specific gravities for the remaining five holes. The average true width of the massive sulphide mineralization is 25.2 feet and ranges from six to 130 feet. This new and inferred geological reserve of 8,000,000 tons represents an addition of 2,200,000 tons to the 5,800,000 tons calculated at the end of 1989.
