LYSANDER GOLD CORPORATION(LYS-V)

CAT CLAIM EXPLORATION TO RESUME IN JUNE - Lysander Gold has committed to its 47% share of the 1991 exploration budget of \$440,000 approved by the joint venture for exploration in 1991 at the CAT property located in the Omineca mining division, B.C. BP Resources with 53% is operator. Lysander in addition owns 100% interest in the centrally located BET claim and 100% interest in claims covering 21 sq. km. adjacent to the north of the Joint Venture and on the of the northern anomaly.

The program consisting mostly of diamond drilling, will test the large sulphide system with associated copper, gold and arsenic soil anomalies that were defined last year. Total dimensions of this system, is 3 km by 5 km. The work is scheduled to start in June.

The program will consist of 18 NQ diamond drilling holes totalling 2733 m. In addition 15 line km of IP - magnetic geophysical survey, soil geochemical survey and geological mapping will be carried out in the north-east of the property where there is evidence of intrusive activity that will provide additional potential targets.

The CAT property covers an alkalic porphyry gold/copper prospect located in the Quesnel Trough in north-central B. C. The property lies north of Mt. Milligan near Kennecott's Lorraine deposit and south of El Cador / Kennecott / St. Phillips, Kemess property.

Previous reported drill intersections at the top of the Cat Mountain near the Bet zone were:

<u>HOLE NUMBER</u>	<u>INTERVAL FROM-TO</u>	<u>INTERVAL FEET</u>	<u>COPPER %</u>	<u>GOLD OZ/TON</u>
89-1	39-156 Ft.	117	0.18	0.042
89-4	75-173	98	0.20	0.015
90-1	10-331	321	0.12	0.035
90-3	10-253	243	0.53	0.01

This drilling followed up trench results in 1989 which exposed extensive copper mineralization associated with epidote-k feldspar alteration with widespread multiple fracture-shear zones developed within volcanic rocks and syenetic intrusives. Previous reported trench values include 1.64% copper and 0.02 oz. gold/ton across 97 ft; 0.64% copper and 0.13 oz. gold/ton across 15 ft; and, 0.23% copper and 0.03 oz. gold/ton across 166 ft.

This BET zone has been described as being analogous to the mineralized Creek and Esker Zones that are peripheral to the Mt. Milligan copper/gold deposit.

In addition, holes 90-14 at the bottom of the CAT Mountain on the edge of a major, IP anomaly was described by Lysander's consultant, Mark Rebagliatti, P. Eng., as having the alteration and style of sulphide mineralization that are compatible with the fringe area of a large mineralized porphyry copper system.

The 1991 program will drill test the large sulphide system east of the BET zone and north-east of hole 90-14.
