

TEUTON RESOURCES CORP. (TUO-V)

**COPPER GOLD PORPHYRY - President, D. Cremonese,
TO BE FURTHER DRILLED** P. Eng, has reported a
modest program of geophysical
surveys, prospecting, trenching, sampling and limited
geological mapping was completed in 1991 by Teuton
Resources on the 100% owned Tennyson claims, 4 miles
west of the Granduc mining road, about 30 miles north of
Stewart, B.C.

From 1986 to 1990, the property was explored by 17
diamond drill holes on vein-type targets, certain of
which carried high grade gold. Few of the samples were
assayed for copper. It was decided to re-evaluate the
property as a potential copper-gold porphyry target. A
trench to test pronounced malachite staining. The
weighted average grade of 9 continuous chip samples
taken along a combined length of 85 ft. came to 0.017
oz/ton gold and 0.35% copper. Similar malachite
staining has been observed in previous work programs at
many places along the 2,500 by 1600 ft. exposure of the
alteration zone.

Also during the 1991 program several new quartz
veins were discovered on the western margin of the
alteration zone. Grab samples from these veins assayed
2.23 oz/ton gold, 29.11 oz/ton silver. High-grade float
boulders from undetermined sources were also located.

A follow-up 1992 program will include drill testing
of the copper-gold mineralization.
