WESTERN CANADIAN INVESTA

CANADIAN WEST RESOURCES LTD. (CW-V)

SILICA PROPERTY ACQUIRED - Dale Wallster, director, reports Canadian West Resources Ltd. has acquired an industrial minerals property located about three miles southeast of Bridesville, B.C. on undisclosed terms. The property, called the QTZ No.1 claim, covers a silica deposit which occurs as quartz bodies contained within chloritic schists. These quartz bodies form small knolls which rise topographically above the rolling terrain. Although it is estimated the current tonnage potential is over 2,000,000 tonnes of high quality silica, further exploration will be necessary to determine the exact grade and tonnage of silica. Previous analytical work indicates the silica-rich rock could be accepted as a container glass feed material and as a source of ferrosilicon in local Pacific Northwest markets. Certain parts of the deposit may provide materials suitable for making silicon metal.

Ben Ainsworth, P.Eng., consultant, has recommended an initial exploration program costing \$50,000 and consisting of diamond drilling and market research. (SEE GCNL No.167, 29Aug91, P.4 FOR OTHER INFORMATION)
