BARKHOR RESOURCES INC. (BHO-V)

KOKANEE EXPLORATIONS LTD. (KOO-V)

STAR DRILLING HITS MINERALIZATION - Gerald R. Newcomen, president, Barkhor Resources Inc., reports current drilling on the Star property located 55 km southwest of Cranbrook, B.C. has intersected sulphide mineralization in two holes. The Phase II program, costing about \$350,000, will complete Barkhor's \$600,000 expenditures to earn a 50% interest in Kokanee's interest. Kokanee has an option to earn a 100% interest, subject to a 1% net smelter return royalty with a \$1,000,000 cap by paying various advance royalties and issuing 65,000 shares.

Hole S91-10, drilled 700 meters south of the main zone, intersected numerous small veins and veinlets of base metals, as well as cutting the stratiform zone at 1,835 feet. Hole S91-11, drilled beneath hole S91-1, intersected a significant amount of veins and veinlets and some bedded zones throughout its length. The increase in mineralization compared to hole S90-1 was very noticeable. As well, the Star vein, intersected in holes 90-1 and 2, was also intersected in this hole, confirming a strike length of over 500 feet for the vein. The stratiform zone was also cut at about 1,075 feet within a graphitic-like unit. Although only thin beds were intersected, it showed a significant increase in mineralization compared to hole S90-1 located 120 feet above, which had no stratiform zones. The drill hole deviated to the north, away from the zone of interest by over 150 feet, or 350 feet from hole S90-2; however, it confirmed footwall-bedded tourmalinite beneath the stratiform zone. Assays pending. (SEE GCNL No.133, 11JU191, P.2 FOR PREVIOUS INFORMATION)
