**MASSIVE SULPHIDE DISCOVERY** - Douglas F. Collingwood, president, reports Bakra Resources Ltd. and Yellowjack Resources Ltd. have completed seven diamond drill holes of the 1991 exploration program on the Ore-Hill Summit property located in the southern part of the Sheep Creek gold camp 15 km southeast of Salmo, B.C. Bakra has an option to earn a 50% interest. Core is being split and sent for assaying. The drilling extends the mineralized zone a further 200 metres to the north from that encountered by Yellowjack's 1990 drill program.

Yellowjack in 1990, completed an extensive work program of geological mapping, geochemical surveying and surface rock sampling which outlined an anomalous gold area of at least 1,500 metres by 200 metres. Late in 1990 Yellowjack drilled three preliminary holes and visible gold was noted in four places. Significant intersections included 0.236 oz/ton gold over 10 feet, 0.214 oz/ton gold over 7.0 feet, 0.041 oz/ton gold over 8.0 feet and 0.215 oz/ton gold over 11 feet.

Of the seven holes just completed, five encountered a zone of massive sulphide mineralization (visually lead and zinc). Presently OH-91-08 is drilling to test the down dip of the mineralized zone encountered by hole OH-91-01. (SEE GCNL No.151, 7Aug91, P.2 FOR PREVIOUS INFORMATION)
