\* - Assays pending

PARTIAL TULSEQUAH CHIEF ASSAYS - John Greig, president, reports Redfern Resources Ltd. has received partial assays from the 1991 drilling program at the Tulsequah Chief property located about 40 miles east of Juneau, Alaska in northwest B.C.

The project is Redfern 40%/Cominco 60%. Redfern has an option to buy Cominco's interest. Assays are pending for holes 91-33 and 34; however, intervals in those holes are estimated to be average deposit grade or better. Hole 91-35 is still in progress.

All the holes are in-fill holes within the boundaries of the deposit as defined by previous drilling and are designed to provide better definition where previous drill holes are widely spaced. The above results provide further confirmation of the continuity of mineralization between drill holes.

Detailed computer-based interpretations, recently completed, have significantly improved understanding of the structure, or geometry, of the deposit. A complete geological update is being prepared. Discussions are underway with several major mining companies in regard to Redfern's option to acquire all of Cominco's interest in the Tulsequah Chief project, the Big Bull property and certain surrounding claims.
