BIG JOHN MINE ASSAYS RECEIVED - Pec Santos, president, reports Jopec Resources Ltd. has received assays from samples taken on the second level of the Big John mine, located on the 100%-owned Pend D'Oreille project 17 km southwest of Salmo, B.C. Previously, access to the second level was blocked by caving. Access was achieved by dropping a 100-foot Jacob's ladder down a raise from the first level to allow channel sampling. Weighted average of the channel sampling was 19.35% lead, 17.37% zinc, 0.111% cadmium, 8.02 oz.silver/ton and 0.005 oz.gold/ton for a gross value of C \$394.20/ton at an average width of 6.0 feet.

Underground diamond drilling to delineate the orebody along the dip is in progress and the drill core is being logged and sampled. Visual estimates of the mineralized intersections indicate fairly consistent grades comparable to the samples above and other channel samples. Geochemical soil sampling is in progress.

Geochemical sampling, line cutting, mapping and geophysics are underway at the Snow Creek project near Nakusp, B.C. (SEE GCNL No.101, 26May92, P.3 FOR
