QUINTO MINING CORP. (QU-V)

LUMBY PROPERTY REASSESSED - Paul Schiller, president,
Quinto Mining Corp., reports
its mineral property near Lumby, B.C. has been reassessed
in light of the recognition of the presence of signifi-
cant quantities of massive graphite in what has been

known as a gold-bearing mineralized shear zone.

The company's consultant, Dr. Darryl Drummond,
P.Eng., has reported the economic potential of the
graphite has not been assessed and the property should
be viewed as an industrial mineral/graphite deposit from
which a gold by-product can be produced.

Potential tonnage of the deposit could be large as
a width of 160 feet of graphitic material was exposed in
the underground workings on the 140 East cross-cut. De-
termination of graphite flake quality has begun. Initial
test work on gold samples from areas of massive graphite
has indicated incomplete fusion and hence, gold values
obtained to date will have to be re-evaluated. (SEE
GCNL No.159, 19Aug91, P.3 FOR PREVIOUS PROJECT DATA).
