and 10 mi. SW of Whistler, B.C. To date 22 diamond drill holes have been completed with most of the holes intersecting mineralization. Assays are listed in table above.

All of the drill holes to date have been drilled in the Tedi Pit area. At this time there appears to be three parallel mineralized zones. These have been traced and drilled for a length of 800 feet. They are still open to both the north and south and also to depth.

The Pulse EM survey was done by White Engineering on the Tedi Pit area shows these three zones almost continuously for at least another 4,000 feet in length. At present, La Rock is planning to drill another three to four holes in the Tedi Pit area. When these have been completed, the company will assess the values from all of the shallow drill holes and then decide whether to drill deeper holes. The deeper holes would enable the company to calculate drill indicated tonnage better.
