

KOOTENAY KING RESOURCES INC. (KKG-V)  
THE BEST PLACE TO LOOK FOR A MAJOR MINE  
IS CLOSE TO A MAJOR MINE

Larry R.W. Sostad, president has reported Kootenay King Resources plans to resume a search for a porphyry copper - gold deposit below the overburden filled August Lake valley.

Kootenay King recently acquired the 81 Star Trek units, plus adjoining optioned claims, between elevations 700 to 1,250 meters, 6 km SE of Princeton, B.C., 10 km NE of the, 25,000 ton per day Similco copper mine of Princeton Mining Corp. The southwest part of the property lies within 1.5 km of Similco ground.

To acquire a 100% interest in the Star Trek claims Kootenay King will pay 100,000 shares and \$10,000 by Dec. 31, 1991. The vendors retain a 2% net smelter return giving Kootenay King Resources the option to purchase 1% of this royalty for \$1,000,000.

The Star Trek claims cover similar geology to that of the Similco mines with much of the favourable rock types hidden by overlying Princeton sediments and glacial till. A number of zones anomalous in copper, lead, zinc, silver and gold have been discovered throughout the property by soil and rock sampling. Trenching has confirmed the occurrence of bedrock iron and copper sulphide mineralization containing significant silver and gold values.

Trenching in the South zone, about 700 meters SE of August Lake returned assays: 1.5% copper, and a 1987 drill hole cut 45 ft. of 0.18% copper, 0.01 oz. gold/t.

In the August Lake valley an induced polarization survey in 1989 located an anomaly separate from but overlapping resistivity and chargeability anomalies, suggesting a buried intrusive causing the resistivity high and an associated high sulphide halo causing the chargeability high. This pattern has been a successful indicator of ore at Similco. The overburden in the area of this anomaly is indicated to be 250 feet.

Owing to the favourable location, geology, geophysics and geochemistry of the claims additional exploration is recommended in an effort to discover an economic porphyry copper deposit. The recommended program includes: ground confirmation of previous results, limited geochemical and geophysical survey work, some limited trenching and an extensive diamond drill program. This program is scheduled to start in the early Spring as soon as the financing currently in negotiation is completed. The company presently has 4,673,581 shares issued. Directors are: Larry R. Sostad, Darrell Johnson and Michael Schuss.
