HIGH GRADE COPPER FOUND ON SURFACE - Marino Specogna,  
director, Doromin  
Resources Ltd., reports exploration outlined an area of  
high grade copper surface mineralization on recently  
staked ground on northern Vancouver Island. The surface  
showing outcrops for at least 10 metres. An area  
several hundred metres to the south of the original  
discovery yielded sulphide-rich float which returned  
significant base metal results. The float is abundant  
and appears to originate nearby. The results returned  
were: 0.012 oz. platinum/t, 0.087% cobalt, 0.420%  
nickel, 0.23% copper, 0.18 oz. silver/t and 0.006 oz.  
gold/t; palladium was not assayed for. The results were  
equivalent to 0.23 oz. gold/t. The results are signi-  
ficant as higher grade sections can be expected to be  
found within the host formation. Geological fieldwork  
of the total claim as well as sampling of the extensive  
original sphalerite, galena-rich showing are underway.  
An airborne geophysics survey is expected to start  
shortly.(SEE GCNL No.134, 13Ju192, P.3 FOR PREVIOUS DATA)
