The first batch of reconnaissance chip samples from the Snow Creek Project has been assayed and the results are listed at left. In addition, 30 more reconnaissance chip samples showed geochemically significant values in gold and other metals. These reconnaissance samples were taken from rock exposures along a structural trend of over 7 km in strike length and over an estimated composite stratigraphic thickness of 400 meters. Due to the nature of the exposures the above samples were not taken in a continuous sequence. Jopec Resources holds an option to earn a 100% interest in the Snow Creek property, located 30 km south of Nakusp, B.C. and is attempting to establish the existence of a low-grade, large tonnage gold-silver deposit mineable by open pit in a relatively easily accessible area where environmental concerns are easily addressed. A crew is now conducting detailed channel sampling using roto-hammer drills across the entire stratigraphic section when possible to identify and define the various mineralized zones. This work is being augmented by a crew conducting soil geochem, magnetometer, and Sabr VLF-EM surveys. A diamond drilling program on the Snow Creek Project has been successfully negotiated with Kalmikoff Diamond Drilling Ltd.

After some problems with the compressor and air supply pipe have been solved, the diamond drilling by Kalmikoff Diamond Drilling Ltd. has resumed on the massive sulfides. Drilling and blasting was done on the access drift to collect a bulk sample on the milling ore for analysis and bench tests.
