TROJAN VENTURES INC. (TJV-V)

LARGE TONNAGE POTENTIAL AT GOLD DROP INDICATED - Edward D.Raitt, president, Trojan Ventures Inc., reports analysis of initial geochemical and geological results indicate the gold telluride mineralization on the 100%-owned, past producing Gold Drop property, 10 km NE of Greenwood, B.C., is known to occur over large vertical distances in alkaline igneous related system. This gives the Gold Drop property a potential for large tonnage at depth.

Previous work on the property concentrated on following the surface trace of the property's gold-bearing vein system. Trojan will continue geological, geochemical surface and underground surveys as well as underground bulk sampling and surface trenching. The underground work will test the continuity at depth of the main Gold Drop vein concentrating on the splay vein striking northeast, encountered 30 meters from the portal, where samples assayed 3.09 oz.gold/ton and 19.9 oz.silver/ton. The company is setting up permanent accommodations and communications in Greenwood by June 1. (SEE GCNL No.89, 7May92, P.3 FOR PREVIOUS PROJECT INFORMATION)
