DRILL RESULTS CONFIRM HIGH GRADE COPPER DISCOVERY Alan Savage, president, New Canamin Resources Ltd., reports results from an eight-hole diamond drill program at the

Huckleberry project 130 km southeast of Houston, B.C. confirm the 0.89% copper tested in DDH 93-26, a water quality monitoring well, constitutes a new copper discovery of significance for plans to bring an open pit copper deposit to commercial production. The new East zone is located 4,000 feet east of the Main Zone and is a "blind" deposit in that the mineralization is covered with an overburden of glacial till.

All eight holes contain significant chalcopryrite mineralization both disseminated and within quartz stockwork veining often intruded by mineralized fingers and sills of dioritic intrusive rock. The program, centered on the discovery hole, has confirmed an area of mineralization 600 by 200 feet by 400 feet deep that is open on all sides and to depth. Holes 93-31 and 93-37 which were both lost at 130 feet and 205 feet, respectively, will be redrilled in the next phase of work. The drill intersections in the table above are after overburden intervals.

A Notice of Work has been filed covering 10,000 feet of additional drilling on the East Zone consisting of twenty 500-foot holes on 200-foot centres. New Canamin can earn a 100% interest in the property from Kennecott by spending \$1,500,000 on exploration over five years. Kennecott can back-in for 60%.
