HERA RESOURCES INC. [HRR-V]

DRILL RESULTS ENCOURAGING - David Hjerpe, president, Hera Resources Inc., reports receiving the first assay results of the present diamond drilling program on the Taurus property located near the town of Cassiar in northwest B.C. Initial drilling and trenching results indicate gold-bearing vein systems adjacent to the existing underground workings, striking 800 feet to the west, and a potential system 70 feet to the south. These three new systems were found as a result of trenching done on six of the 92 induced polarization anomalies discovered on the property. Assay results on the first eight of 26 holes drilled have arrived. They cover an area known as the 93-1, 93-2 and 93-3 veins systems. To date, limited drill data indicates zones ranging anywhere from 7.0 feet true width grading 0.53 oz.gold/ton, 10.8 feet true width grading .26 oz.gold/ton, and 20.3 feet true width grading 0.118 oz.gold/ton. The deepest hole to date, drilled to 120 feet, returned values over 8.0 feet true width of 0.25 oz.gold/ton.

Early indications outline gold-bearing systems with good width, depth and grade potential. Further drilling is underway. Hera owns 56% of International Taurus, which owns a 100% interest in 31 claims and has optioned 10 more. (SEE GCNL NO.207, Oct.28/93, P.2 FOR PREVIOUS PROJECT INFORMATION)
