HERA RESOURCES INC. [HRR-V]

TAURUS ASSAYS RECEIVED - David Hjerpe, president, reports Hera Resources Inc. has received assay results of a trenching program completed on the Taurus gold mine ground located near the town of Cassiar in Northwestern British Columbia. A new trenching program revealed four new gold-bearing quartz veins extending up to 500 feet in length, west from the existing underground workings. Mineralized widths on the first of these new veins varies from 2 to 11 feet with assays ranging from 0.03 to 2.2 oz. gold/ton. Trenching is continuing on the other three veins.

The data is under review and a diamond drill program to explore the vein system to depth will start soon. Based on these discoveries and the existing outlined reserves of 300,000 tons of 0.21 - 0.25 oz. gold/ton, inferring 60,000 ounces of gold, management plans to begin gold production on site at its 350 ton per day mill in the near future. Of the 92 anomalies outlined by induced polarization surveys, six have been explored resulting in the above findings. The remaining 86 anomalies still need to be tested.

Hera is buying 2,286,256 shares, or 56% of International Taurus, which owns a 100% interest in 31 claims and has optioned 10 more. (SEE GCNL NO.181, 21Sept93, P.1 FOR EARLIER TRENCH RESULTS AND TERMS OF ACQUISITION)
