INTERNATIONAL TAURUS RESOURCES INC.

[ITU-V] 6,926,696 SHS.

NEW GOLD ZONE DISCOVERED - David Hjerpe, president, International Taurus Resources and Hera Resources Inc., reports a significant new zone to the north of previously reported drill holes has been discovered at the Taurus minesite, located near Cassiar, B.C.. The induced polarization anomaly of this new target area is seven times larger than any IP anomaly drilled before. This strong anomaly extends 2,800 feet along an east-west strike length and is open along strike. To date, five holes drilled are mineralized and assays will be reported as received. The companies plan a new IP program in the spring of 1995 to survey another 1,500 feet of ground to the west of the present workings as it now appears the system continues on.

With six new holes reported overleaf P.3, the companies now have results on 18 holes with another 20 holes to report.

This year \$1,500,000 has been spent on the property which has resulted in a major new gold discovery. Funds are in place to start a major drilling program in the spring which will determine the feasibility of an open pit gold mine situation.

Although little metallurgical work has been done on the property, the companies anticipate using conventional methods of flotation and treatment to recover the gold. Testing will also be done on the feasibility of heap-leaching, as this ore separation method would be more cost effective.

A senior mining engineer with considerable open-pit experience has examined the property for initial evaluation of the open-pit potential. In this opinion more detailed evaluations are warranted. In the next few weeks exploration results from this year's work will be compiled, with the intent of formulating a strategy to deal with several major mining companies that has expressed interest in this project.

Hera owns 56% of International Taurus, which owns 100% of

the 31 Sable claims and has optioned 10 more claims. (SEE GCNL NO.212, 4Nov94, P.1 FOR PREVIOUS PROJECT INFORMATION)
