MORE RAINBOW ASSAYS - James T. Gillis, president, Getchell Resources Inc., 30%, reports joint venture partner Teck Corp., 70%, has received partial assay results for Hole 94-22 drilled on the Rainbow property located near Kamloops, B.C. The location of this borehole, and the location of all other boreholes drilled during the 1994 Phase I and II drill programs are shown on the location map overleaf P.1. This borehole has an azimuth of 032.5° and a dip of -45°.

Hole 94-22 intersected a broad mineralized zone of slightly lower grade than that intersected in drill holes 94-14, 94-17 and 94-21. Borehole 94-22 penetrates 35.1 metres of overburden prior to intersecting a rock package dominated by mafic volcanics through to 132.85 metres. From 132.85 metres to the end of the borehole at 292.9 metres, the borehole cuts a mineralized and altered dioritic intrusion. The contact of the mineralized intrusion with the unmineralized volcanic rocks is likely to be sub-vertical. The following mineralized zones are noted:

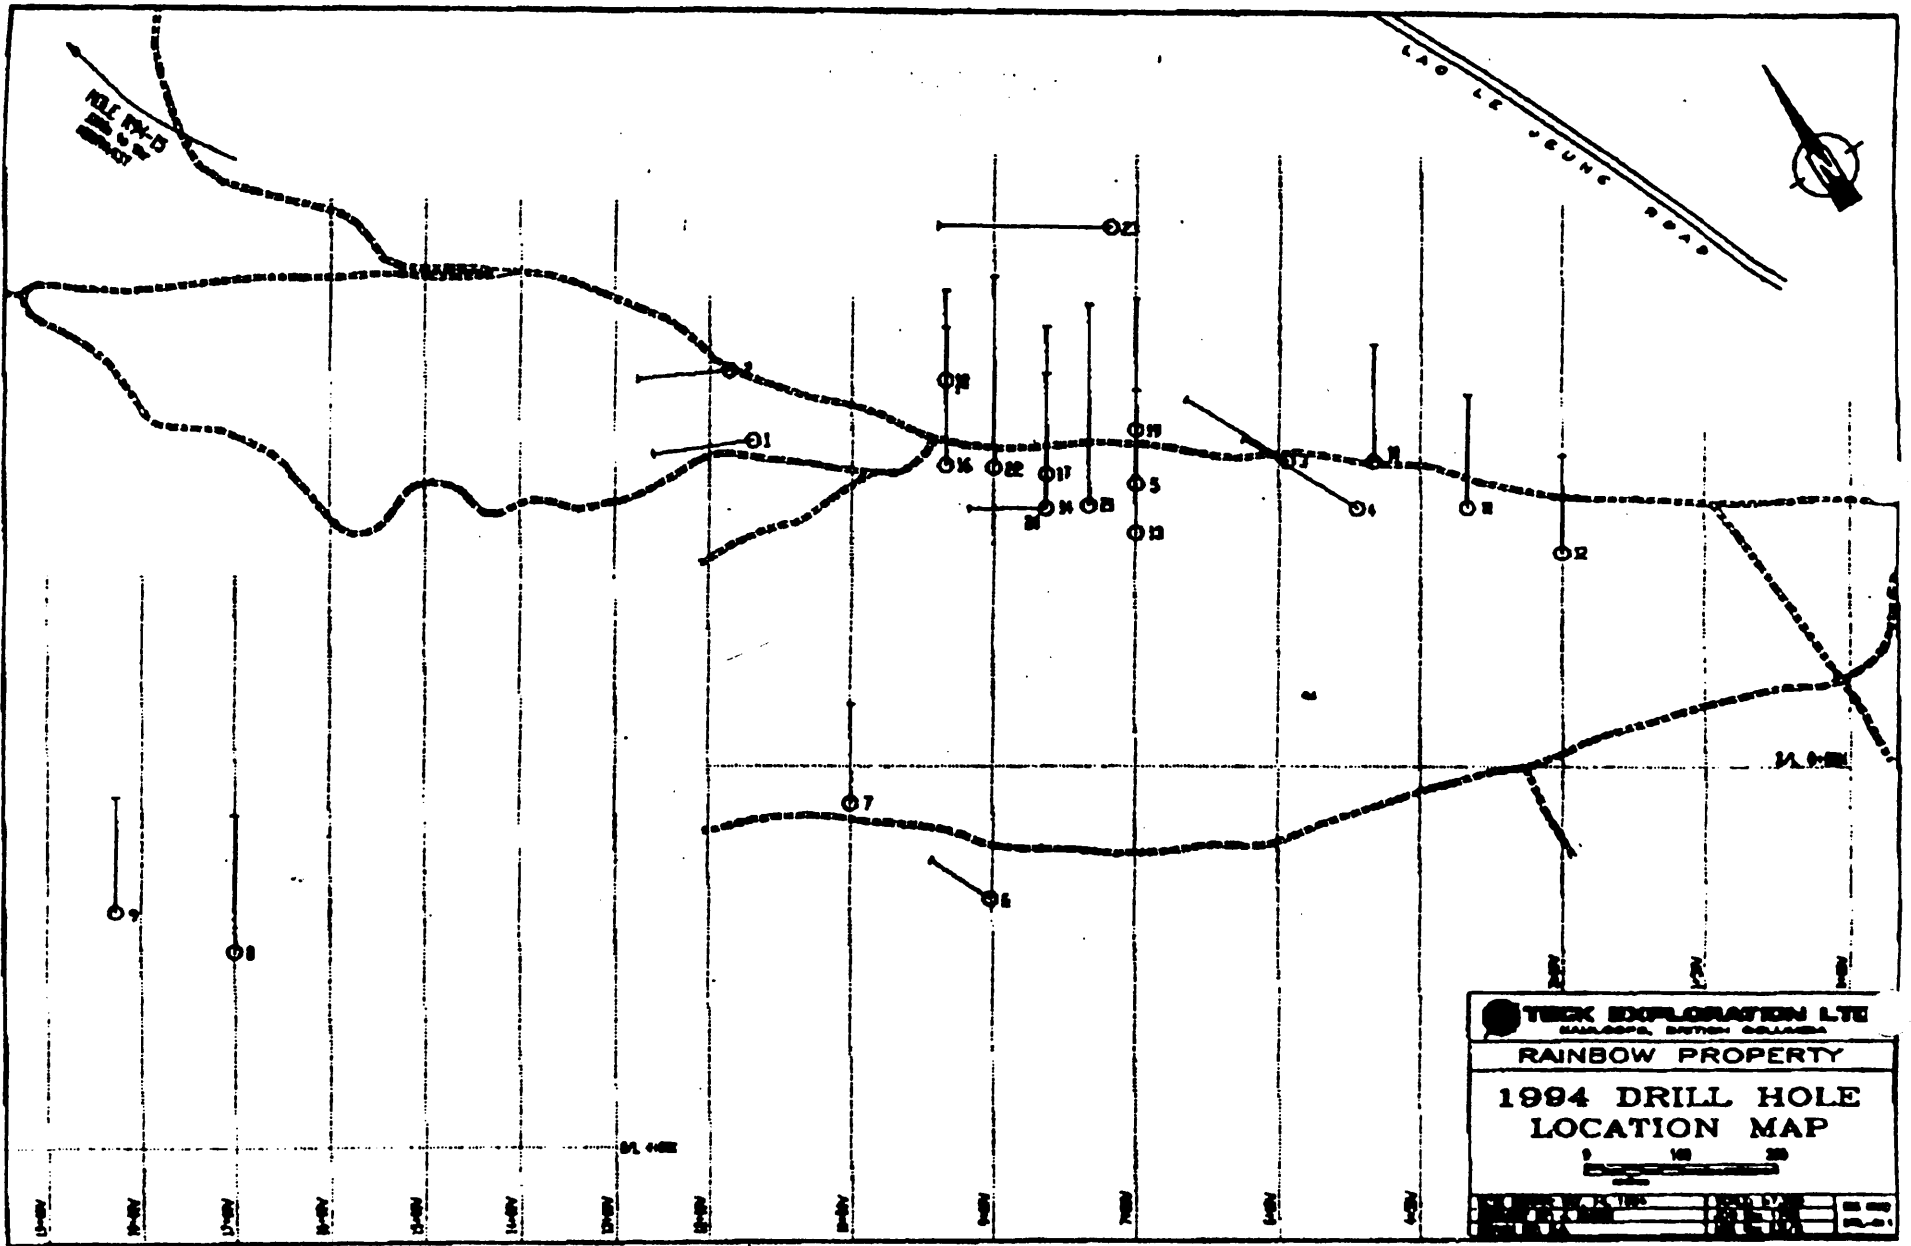

<u>INTERVAL</u> <u>METRES</u>	<u>LENGTH</u> <u>METRES</u>	<u>COPPER</u> <u>%</u>
132.85 - 158.35	25.5	0.22
158.35 - 189.9	31.55	.47
189.9 - 232.0	42.1	.30
232.0 - 249.65	17.65	.07
249.65 - 292.9	43.25	.27

These intersections are reported as core lengths. True widths of the zone are yet to be determined. Assay results have not yet been received for drill hole R94-23.

A third phase of drilling, totalling a minimum of 6,000 feet, is currently being planned to test the up-dip extent of the mineralized intrusion intersected in DDH's 94-14, 94-17, 94-21 and 94-22. Other areas of exploration interest will also be tested during Phase III drilling. Getchell Resources will be funding 30% of the anticipated costs of this phase of exploration. (SEE GCNL NO.196, OCT.13/94, P.1 FOR PREVIOUS RAINBOW DRILL RESULTS)
