ECSTALL MINING CORP.

[EAM-V] 3,860,000 SHS.

MORE ENCOURAGING ASSAYS FROM AKI PROJECT - Metall

Corp. has released assays from drill hole A-94-7 on Ecstall's Aki Mining claims massive sulfide discovery in northeast B.C. which is developing into the most significant new lead-zinc discovery in B.C. since the Cirque deposit was found in 1978.

Drill hole A-94-7 intersected 42.3 meters of laminated polymetallic massive sulfide and shale, containing 45 to 80% laminated pyrite and sphalerite. In the 90 meters down dip from hole A-94-5 to A-94-7, the zinc grade and width has increased considerably along with a thickening of bedded barite.

A table of average preliminary assays several intervals between 186.8 meters and 236.76 meters in drill hole A-94-7 show an average of:

INTERVAL (M)	LENGTH (M)	ZINC %	LEAD %	ZINC+LEAD %
197.80-214.40	16.6	5.32	0.93	6.25
189.90-232.10	42.30	4.75	.83	5.58
223.50-232.10	8.60	6.39	1.10	7.49

Drill hole A-94-8 has since been completed 1.0 km northwest

along strike from drill hole A-94-7. Hole A-94-8 has intersected approximately 9 meters of interbedded shale, laminated pyrite and sphalerite. Assays are pending. This intersection is preceded by an upper laminated pyrite zone and is followed by a bedded barite and shale zone, as seen in other holes. With this intersection in drill hole A-94-8, sulfides have now been traced along a strike length of 1.40 kms.

Drill hole A-94-9, now underway is a near vertical hole to test the horizon approximately 240 meters down dip from A-94-8.

Metall can earn a 55% interest by spending \$1,500,000 on exploration and making option payments. (SEE PROPERTY LOCATION MAPS AND PREVIOUS REPORTS IN NO.157, P.1, 17AUG94)
