GOOD MOLY VALUES REPORTED - Larry Reaugh, president, reports Amcorp Industries Inc. and Verdstone Gold Corp. report assay results of hole 95-9 drilled in the MOR area on the 100%-owned Crow-Res molybdenum property located near Summerland, 15 miles south of the major past producing Brenda copper/ moly mine. The MOR area is located on the south edge of a 1,200 by 550-foot moly soils anomaly. Drill hole 95-9 is termed the "discovery hole" based on excellent visual moly content. The companies are pleased with the following results even though substantial losses of coarse molybdenite has occurred along the fractures while drilling. Significant results are tabled below.

SAMPLE NO.	INTERVAL METRES	LENGTH METRES	MOLYBDENUM %	MoS <sub>2</sub> * %
25092-25100	8 - 17	9	0.256	0.443
25107	23 - 24	1	.165	.276
25109-25110	25 - 27	2	.159	.266
25117	33 - 34	1	.688	1.149
25121	37 - 38	1	.705	1.177
DRILL HOLE NO. 95-9				
25035-25037	7 - 10	3	.431	.720
* MoS <sub>2</sub> EQUIVALENT				

Hole 95-9 was drilled at 45° north toward the soils anomaly. Results have also been received from the initial drill site (1,200 feet southeast of discovery hole 95-9) from holes 1 and 2 with significant results tabled above.

The MOR area is open in all directions with drilling and trenching continuing on an ongoing basis. Magnetometer surveys are currently being conducted over the area to better located drill sites. Due to the extent of mineralization and alteration, a larger exploration program is being planned for this winter. Other drill results will be reported as received.
