LLOYD-NORDIK ASSAYS RECEIVED - Lloyd Tattersall, president, reports Big Valley Resources Inc. has received assay results from ongoing diamond drilling and trenching on its 100%-owned Lloyd-Nordik property located in the Cariboo region about 50 miles east of Williams Lake, B.C. The results reported overleaf P.2 are for surface trenches and diamond drill intervals on the Lloyd 2 and Nordik Southeast target

areas of the property.

The Lloyd 2 target has been interpreted as a sequence of felsic volcanic rocks and porphyritic sills and dykes with magnetite-healed breccias hosting copper and gold mineralization. The results from the recently completed trenching on the Lloyd 2 target indicate the near surface copper and gold mineralization encountered in diamond drill holes 94-4, 94-6 and 94-16 continues to the south and the east of these drill holes. Diamond drill hole 94-12 represents a step-out of about 120 metres to the south of the previously known southern extension of the Lloyd 2 mineralization. The mineralized zone remains open to the south.

Diamond drill holes 95-31, 95-33 and 95-34 were drilled to the Nordik Southeast target, located about five km southeast of the Lloyd 2 zone. The Nordik Southeast is a magnetic/chargeability high coincident with potassic altered monzonitic to dioritic intrusive and volcanic rocks. Drill results indicate disseminated sulphides occur along the flanks of a dioritic intrusion. Further work is ongoing on both the Lloyd 2 and Nordik Southeast targets as well as other targets on the property. (SEE GCNL NO.233, 5Dec95, P.2 FOR PREVIOUS LLOYD-NORDIK PROJECT INFORMATION)
