WINTER EXPLORATION PROGRAM NOW UNDERWAY
SEEKING EXTENSION TO IMPERIAL METALS'
MOUNT POLLEY COPPER/GOLD PORPHYRY ORE BODY

LLOYD-NORDIK PROJECT CONTAINS NUMBER OF
TARGETS WITH LARGE TONNAGE COPPER/GOLD POTENTIAL

Lloyd Tattersall, president, has reported Big Valley Resources Inc. has scheduled the resumption of drilling mid-February 1995, on the 100%-owned, 26,871-acre Lloyd-Nordik copper/gold property. The claims are in the Quesnel Trough, at 1,000 metres elevation, 65 km north east of Williams Lake, B.C. and adjoining the north and east borders of the Mount Polley copper/gold orebody of Imperial Metals/Bethlehem Resources. First assay results are expected by mid-March.

The same favourable geology has been confirmed by geological mapping and trenching to extend from the Mount Polley property on to the Big Valley ground. The Mount Polley orebodies are associated with the coeval, alkaline Polley breccia porphyry stock which is an intrusion into felsic volcanics. The work has established the favourable geological setting extends in a belt for 10 km to the northwest of the Lloyd Nordik/Big Valley discovery area all within the claims recently staked by the company. During 1994 Big Valley carried out two phases of additional staking adding a total of 19,026 acres to the formerly held 7,845 acres for the current holdings of 26,871 acres. This belt extends to the area of the QR deposit which has reserves of 1,307,000 tonnes grading either 6.25 or 4.7 grams gold/tonne, or 0.17 oz. gold/ton, the grade varies with different reports. The QR deposit is currently being brought into production by Kinross Gold Corp. Geophysical, soil geochemical and geological mapping surveys are planned to define additional anomalies and drilling targets on the balance of the belt within the company's claims.

During December 1994, Big Valley completed a land survey to determine the exact location of the boundary with the Mount Polley claims. New survey grid lines were cut at 25-metre intervals and a detail magnetometer survey with 10-metre reading was completed to define and extend anomalous targets located in earlier aerial and ground magnetometer, and induced polarization surveys. Prior to 1993, a former joint venture partner spent \$250,000 exploring the claims. As seen in a 1990 geophysical compilation MAP OVERLEAF P.3,4 and 5, the earlier surveys defined coincident and/or adjoining chargeability high, resistivity low, resistivity high, magnetic high and magnetic low areas. Several of these targets are open to extension at the limits of the old survey grids. Recent survey work has further defined and extended these targets. A new anomalous target has been located by the recent survey with detail definition now underway. The Mount Polley deposits have a strong magnetic response with a broader induced polarization chargeability response. As well, the Mount Polley deposits were defined by earlier soil sample surveys. A soil sample survey in 1989 on the Lloyd Nordik claims defined a copper anomalous area.

Diamond drilling in 1994 tested the magnetic high portion of a 500-metre northeasterly trending chargeability structure and

provided assay results shown in the TABLE OVERLEAF P.5. The drilling established the anomalous targets were caused by copper and pyrite mineralization. Further drilling to establish tonnage and grade was recommended and is scheduled to start mid-February.

RECENT FUNDING - CAPITALIZATION - To fund this program

Mr. Tattersall and his family bought private placements: Oct. 28, 1994, of 100,000 units at 50¢; Jan. 17, 1995, a 476,200 unit private placement at 21¢ each with warrants exercisable at 28¢ each; and on Jan. 26, 1995, exercised options on 275,000 shares at 20¢ each to raise a total of \$255,000. Also the exercise of the warrants from these private placements could yield a further \$200,000. In addition Big Valley has been awarded an exploration grant by the B.C. Ministry of Mines and Resources of up to \$76,900 toward the exploration program. These fundings bringing the issued shares to 10,803,730 or 11,361,730 shares fully diluted. See some details in GCNL No. 228, P.6, Nov. 29/94.

Mr. Tattersall noted a number of conversations have been held with Imperial Metals management to share geological data. A number of major company geological representatives have examined the property and the data. While the company is open to possible joint ventures on several portions of the property, no discussions are currently underway, he stated.

OFFICERS DIRECTORS AND CONSULTANTS - Lloyd Tattersall, president; Nick Theissen, director; David Horst director; Myrna Tattersall, secretary. Consultant Rudolf, M. Durfield, B.Sc., P.Geol., and J.E. Wallis, P.Eng. Investor relations are by Kelly MacDonald of Dimac Capital Corp. telephone (604) 925-0220, fax 925-3640. Company office is at Box 4210, Williams Lake, B.C. V2G 3V2. (604) 243-2337.
