HORSEFLY ASSAYS RECEIVED - Peter DeLancey, president, reports  
Atna Resources Ltd. and Ecstall  
Mining Corp. have received assay results from the Horsefly property  
located 80 km southeast of Prince Rupert, northwest coast, B.C. SEE  
MAPS & ASSAY TABLE OVERLEAF P.1. Eight diamond drill holes,  
totalling 3,530 feet, tested several Max-Min EM anomalies  
coincident with a +2 km long sequence of mineralized volcanic and  
argillaceous rocks. Significant copper mineralization was  
intersected in four drill holes. The copper values are associated with  
disseminated, laminated and semi-massive pyrrhotite, pyrite and  
chalcopyrite. Copper mineralization, intersected over about 70 feet,  
near the bottom of holes 6 and 8, is hosted in a distinctive altered  
volcanic unit. This mineralized unit is open in all directions. (SEE  
GCNL NO.200, Oct.18/95, P.2 FOR PREVIOUS HORSEFLY  
PROJECT INFORMATION)
