ECSTALL MINING CORPORATION

[EAM-V] 4,403,000 SHS.

JUNCTION COPPER PROJECT - Chris Graf, P.Eng., president,
DRILLING UNDERWAY Ecstall Mining Corp., reports
Hudson Bay Exploration and

Development Company Ltd. has begun a diamond drill program of
two to three holes (1,000 ft. in total) on Ecstall's 100%-owned
Junction claims located in the Flathead Valley of southeastern B.C.

In February 1994, Ecstall entered an option agreement under
which Hudson Bay can earn a 65% interest in the Junction claims by
spending \$1,000,000 on exploration and making \$150,000 in
option payments over five years.

The principal exploration target on the property is the 700-
metre long Pincher zone of anomalous soil geochemistry and bedded

copper mineralization hosted by dolomites of the Precambrian Belt-
Purcell Sheppard and Kintla formations. These belt-Purcell rock
formations extend southwards into northern Montana where they
host the world class Montanore, Rock Creek and Spar Lake redbed
copper-silver-deposits/mines.

Hudson Bay carried out a work program in 1994 which consisted
of further claim staking, geological mapping, rock sampling, soil
sampling, stream sampling and backhoe trenching (225 metres).
The present diamond drill program will test the prospective dolomite
bed that contains chalcopyrite and chalcocite copper mineralization,
along a 700-metre strike length.

The dolomite horizon on the Junction property is up to 10
metres thick with sections containing finely disseminated
chalcopyrite (copper) mineralization. The host horizon has been
traced by a series of backhoe trenches and prospecting for about 700
metres. (SEE GCNL NO.161, 22Aug95, P.3 FOR AKIE PROJECT
