BOOKER GOLD EXPLORATIONS LTD.

[BGE-V] 5,307,023 SHS.

HEARNE HILL EXPLORATION RESULTS - Hugh Grenfal, president,
Booker Gold Exploration Ltd., reports assay and induced polarization results on its 100%-owned, subject to 4% NSR, Hearne Hill project 65 km northeast of Smithers and 15 km north of the Bell Copper Mine in the Babine Lake District of B.C.

During the previous field season, drilling indicated a high grade copper-gold zone northeast and contiguous to the copper-gold porphyry outlined by a Texas Gulf Sulphur drilling program in the mid-1960's. An induced polarization survey covering an area one km by one km was completed 19Aug95 and had defined a corridor 300 metres by 500 metres of high chargeability and very low resistivity. Step out drill hole DDH95-13 is located at the outer limit of this IP anomaly while DDH95-14 advanced 50 metres northeast into the zone and has indicated the IP targets represents a relatively high grade copper-gold core, previously unknown, in an extended or new porphyry copper system.

DDH95-13 was drilled vertically to a depth of 788 feet and returned a 60-foot section (683-738 ft.) averaging 0.45% copper and 0.22 grams gold/tonne. The hole bottomed in a 15-foot section averaging 0.43% copper and 0.19 grams gold/tonne.

DDH95-14 is also being drilled vertically and the top half has revealed a 110-foot section (403 to 513 feet) averaging 0.64% copper, 1.3 grams silver/tonne and 0.25 grams gold/tonne. The hole is continuing in mineralization and is expected to be completed shortly. Results will be released as soon as possible. (SEE GCNL NO.151, 8Aug95, P.2 FOR PREVIOUS HEARNE HILL DATA)
