CUSAC/TAURUS GOLD PROJECT REVIEW - Guildford H. Brett,
president, Cusac
Gold Mines Ltd, and partner International Taurus Resources Inc.,
report some excellent assay results from the latest drill holes on the
Cusac/Taurus project near Cassiar, B.C. The property is being
explored by Cyprus Canada Inc. which can earn a 50% interest in
certain areas under agreements with Cusac and Int'l Taurus.

The results now make it possible to project a geological
resource to date of almost 3,000,000 ounces, with more than half the
current drill program yet to be reported and/or completed.

Eleven drill hole results were reported; see assay table overleaf
P.1 and drill hole map overleaf P.2. Three of the holes (29, 32, 35)
are in the Taurus West area on line 11-West (just north of the hole
13, the deepest mineralized hole so far). Hole 95-29 is one of the
most encouraging holes to date with 162 metres of gold
mineralization averaging 1.37 grams gold/tonne (0.040 oz/ton)
which includes 86 metres of 2.47 grams/tonne (0.072 oz/ton). Hole
95-32 has gold mineralization over a width of 172 metres averaging
0.83 grams gold/tonne (0.024 oz/ton) with 44 metres of 1.55
grams/tonne (0.045 oz/ton), while hole 95-35 has mineralization
over a width of 187 metres averaging 0.37 grams gold/tonne (0.011
oz/ton) with 74 metres of 0.74 grams gold/tonne (0.022 oz/ton).
These widths and grades are considered to be favourable for a
potential large tonnage, low grade open pit mine.

The other eight drill holes were in the area of the Taurus Portals,
about 1,100 metres east from line 11W. The results indicate the
presence of local zones of similar grade to that in the Taurus West
area but over generally narrower widths. The best result in the Taurus
Portal area is for hole 95-36 which returned 39 metres grading 1.29
grams gold/tonne (0.038 oz/ton). The results appear to be erratic due
to considerable faulting.

The results of the drilling by International Taurus in late 1994
and of the 37 drill holes (for which assay results are available) by
Cyprus Canada so far in 1995, now make it possible for Cusac and
Taurus to calculate a drill indicated geological resource for the
Cusac/Taurus gold project, using an average thickness of 55 metres.

Independent calculations by Cusac and Taurus project that, to
date, there are at least 100,000,000 tons with an average grade of
0.029 oz.gold/ton, thus containing at least 2,900,000 ounces of
gold. The potential to increase this resource estimate significantly
is considered very good, with three quarters of the induced
polarization anomalies yet to be drilled.

Cyprus Canada Inc. continues the drilling and exploration
program. Results will be released on a regular basis. (SEE GCNL
