MOLY PROJECT DRILL RESULTS - Larry W. Reaugh, president,
Amc Corp Industries Inc. and
Verdstone Gold Corp., reports assay results on Holes No. 20 and No.
21 from the 100%-owned Crow-Rea molybdenum property near
Summerland, south-central B.C.. See table below:

HOLE NO.	INTERVAL FEET	TOTAL FEET	MoS ₂ %
20	33- 36.25	3.325	0.546
	76.5- 86.5	10.0	.040
	210-216.5	6.5	.072
21	55.6- 62	6.5	.104
	108-144	36.0	.213

Further results will be reported on when received. Exploration to date on the Webb Site zone has found strong alteration indicative of a molybdenite mineralized porphyry system. The alteration breccia, potassium metasomatism, clayed feldspars, blue green sericite clay alteration, and of course molybdenite mineralization. The size and extent of the alteration and molybdenite mineralization suggest there is a major plumbing system capable of holding a major deposit on the property. The Webb Site is a new molybdenum find discovered by the company in September 1995.

Work is now concentrated on following the ore grade mineralization in order to begin to establish size and tonnage. (SEE GCNL NO.9, 12Jan96. P.2 FOR PREVIOUS MOLY PROJECT DATA)
