HOMESTAKE CANADA INC.

RED MOUNTAIN HIGH GRADE - Dino Cremonese, president,
GOLD ASSAYS RECEIVED Teuton Resources and 50/50 joint
venture partner Minvita

Enterprises Ltd., has reported diamond drill results on the 100%
owned Red Mountain area property 15 miles east of Stewart,
northwest B.C. On Dec. 15, 1995, Homestake Canada Ltd., 51%,
and Prime Resources Group Inc., 49%, bought 500,000 shares of
Teuton at \$2.64 and 350,000 shares of Minvita at \$3.79 each and
received first rights on any sale of the property plus any subsequent
funding by either of the companies.

The drilling program which began Oct. 29, 1995, tested at
depth, a limited portion of the H-1 and S-2B zones exposed by the
past summers trenching. Thirteen holes over 3,500 feet were drilled
from a single pad located east of trench No. 12. The holes were

drilled on four separate azimuths at various angles. REFER TO THE
ATTACHED PROPERTY PLAN VIEW OVERLEAF P.1 FOR THE
DRILL COLLAR LOCATION AND OVERLEAF PAGE TWO FOR
TABLE OF ASSAYS. The surface trace of the sections drilled (A
through D) are shown. Weather conditions prevented the drill from
being moved to a second location and the program was halted on
November 6, 1995.

A discrete target area, of 40 metres strike length and 20 to 70
metres of dip, was selected to begin testing the H-1 zone. This target
only represents 20% of the known strike length of the H-1 zone
which appears to be a series of subvertical, en-echelon structures that
contain stockwork and breccias, commonly filled with hematite,
magnetite and locally native gold. The two southeastern drill
sections, C and D, targeted down dip extensions of the H-1 zone
exposed in trenches 4, 14 and 15. Significant gold mineralization
was intersected within 40 metres of the surface, particularly in holes
95-10, section D, and 95-8, section C, which returned 63.4 opt gold
over 4.2 m. estimated true width and 57.4 grams gold/tonne over 1.7
metres true width, respectively. Preliminary interpretation suggests
the H-1 zone appears to bottom out at about 40 metres depth on
section D. However, surface trench results indicate the zone remains
open to the southeast where the H-1 appears to dip steeply to the
southwest. To the northwest, on sections A and B, the H-1 zone
thins to about 0.6 metres true width, carry between 17.9 and 48.3
grams gold/tonne and is open at depth and to the northwest.

To the southwest of the H-1 zone, subparallel steeply dipping,
0.8 to 1.3-metre intersections of 2.8 grams gold/tonne in several
holes are probably the down dip extension of the S-2B zone. The S-
1 and S-2A zones are located southwest of the H-1 and S-2B zones
and were not tested by any of the drill holes. The combined 470
metres of strike length of the S-1 and S-2A zones and the
southeastern extension of the H zone are exploration targets and will
be drilled in 1996.

Dino Cremonese, president of both Teuton and Minvita said,
"The results are encouraging, and demonstrate down-dip continuity
in three out of four sections drilled. However, it should be
emphasized the results are from a single drill location and we are still
at a very early stage in the exploration of the property. Data
plotting and geologic interpretation will continue and should
provide a better understanding of all of the "H" and "S" structures
before starting the 1996 drill program. (SEE GCNL NO.6, 9Jan95,
