DRILLING EXTENDS GOLD ZONE - J. Paul Stevenson, director, reports results from recent drilling in a new area suggest that additional enriched copper-gold mineralization exists parallel to the Bland-Chapman zones at the 100% optioned Hearne Hill project 65 km east of Smithers, BC. Chalcopyrite, gold and molybdenite were encountered in diamond drill holes 50 metres west of the Bland zone. Intercepts of 0.27% to 0.77% copper, 0.10 grams gold/tonne and 0.031% molybdenum were present in DDH-97-108 to 97-110. SEE TABLE OVERLEAF P.1. Mineralization in this area is hosted by fragmental biotite-feldspar-porphry that has a north-easterly strike. Geological interpretation suggests mineralization extends 300 metres to the southwest where a similar host rock was encountered in drill holes 96-51, 52, 57 and 61. Grades of 0.90% copper over 10 feet intercepts were encountered in DDH-96-57, 0.51% copper in DDH-96-52 and 0.47% copper in both DDH-96-57 and DDH-96-61. The drill has now been moved 250 metres to the southwest where drilling will test this geological model.

Booker Gold has hired two additional full-time geologists to continue geochemical sampling and geological mapping within the 19,000 acres of claims surrounding Hearne Hill. Exploration during the summer of 1997 will include detailed mapping and sampling near geochemical anomalies identified on a property scale, continued geochemical sampling both to the east and west of the present grid area, and a regional sampling and mapping program over the entire claims. A geophysical crew has been contracted to extend Mag/VLF and IP/resistivity coverage to the east and west of the present grid area. (SEE GCNL NO.80, 25Apr97, P.2 FOR PREVIOUS HEARNE HILL PROJECT INFORMATION)
