UNUK GOLD CORP.

[UNK-V] 2,458,107 SHS.

DAISY PROJECT UNDERWAY - Raymond Roland, director, reports Unuk Gold Corp. has begun a work

program on its 100% optioned Daisy property located 38 km southeast of Merritt, south-central BC. The claims are underlain by Nicola Group marine volcanics and diorite intrusives of Upper Triassic to Lower Jurassic age. Major regional north-south trending structures of the Kentucky Alleyne fault system cut the property and are believed to be responsible for mineralized shear zones and other styles of structurally controlled mineralization found on the property.

Previous work on the claims identified copper, zinc and silver mineralization in shear zones. In a six hole program in 1979, Cominco had one intersection of 0.14% copper over 32 metres.

Unuk Gold's current program consists of detailed geologic mapping and sampling, geochemical grid sampling and a magnetometer-VLF geophysical survey over most of the prospective targets.

Unuk Gold can earn a 100% interest in the Daisy claims by paying \$150,000 in stages and issuing 100,000 shares by 31Dec98. The claims are subject to a 2% NSR, 1% of which can be purchased for \$500,000. (SEE GCNL NO.134, 14Jul97, P.9 FOR PREVIOUS DAISY PROJECT INFORMATION)
