BENNETT DRILL RESULTS - Terry Tucker, P.Geo., director, Brett Resources Inc., report drill results

from the Bennett project near Bennett Lake, Atlin area, northwestern BC. Brett has an option to earn a 60% working interest in the project from Westmin Resources Ltd. by spending \$1,800,000 over three years. In addition, Brett may earn an additional 15% by funding all further expenditures to completion of a feasibility study. The 1997 drill program tested the Skarn Zone with eight drill holes and the Plateau Anomaly with two drill holes. A total of 1,073 metres in 10 diamond drill holes was completed. SEE MAP OVERLEAF P.1.

At the Skarn Zone, drilling was previously completed from a single setup in 1990. This encountered several potentially significant intersections including 8.0 metres averaging 3.4 grams gold/tonne, 7.0 metres averaging 3.7 grams gold/tonne, 9.9 metres averaging 2.1 grams gold/tonne 4.0 metres averaging 7.4 grams

gold/tonne and 4.0 metres averaging 4.9 grams gold/tonne.

Drilling this season was designed to determine the controls and possible strike extension to the south of the known mineralization of the Skarn Zone. The most significant mineralization encountered in the 1997 drill program was intersected in holes BN97-08, -09, and -10, located 250 and 300 metres respectively south of the 1990 drilling. BN97-08 results included 2.0 metres averaging 1.95 grams gold/tonne while drill hole BN97-09 returned 7.64 grams gold/tonne over 3.5 metres. In addition, a 0.3 metre interval returned 1.32 grams gold/tonne. Hole BN97-10 returned 5.96 grams gold/tonne over 1.5 metres. The Skarn Zone mineralization intersected in these three holes is open to the south.

Drill holes BN97-03 to 07 were drilled between holes 8, 9, 10 and the 1990 drill holes. Continuity of the skarn mineral was established between the two zones by this drill program. However, the holes returned only geochemically anomalous gold at the target.

At the Plateau Anomaly, the first two holes of the program tested the high chargeability low resistivity geophysical target known as the Plateau Anomaly. Drilling identified the cause of the geophysical anomaly as black graphitic fault breccia with quartz-carbonate fragments and local pyrite concentrations. Samples from the interval between 33.20 metres and 88.50 metres contained numerous geochemically anomalous gold values. Compilation of all results is now underway and a proposal for further work on the property is expected soon. (SEE GCNL NO.165, 27Aug97, P.7 FOR PREVIOUS BENNETT PROJECT INFORMATION)
