DOBBIN PROJECT UPDATE - Larry W. Reaugh, president, Verdstone Gold Corp., and 50/50 joint venture partner Molycor Gold Corp., reports on the second stage of exploration at the 100% owned Dobbin prospect, on the southwest slope of Whiterocks Mountain, located 27 km west of Kelowna, BC.

Andris Kikauka, P. Geo, the companies' consulting geologist is directing the exploration. His report states: "DDH's 97-10 to 15 were collared 75-150 metres west of the Discovery Zone (defined by DDH's 3, 7 and 8) to test the depth extension of copper-platinum-palladium bearing mineralization hosted in hornblende gabbro and alkali pyroxenite. Core drilling has identified copper-platinum-palladium bearing gabbro and pyroxenite zones which are intruded by a mafic porphyry. Correlation of geological data suggests gabbro/pyroxenite zones, range from 10 to 250 metres in width and occur as steep west-dipping layers, lenses and stocks (pipe-shaped). DDH 97-16 was collared 20 metres northwest of Discovery Zone DDH's 97-7 & 8 and has encountered continuous gabbro/pyroxenite over its entire length in excess of 350 metres. The interval from 240 to 350 metres depth has encountered a stringer zone of quartz-calcite-epidote garnet veinlets."

The results from analyses of DDH 97-16 indicate increasing grades of mineralization occurring at depth. This was found in DDH 97-07 reported previously. Drilling is continuing.

A program to extend previous soil sampling has recently been completed and the copper geochemistry in soils confirms the copper anomaly extends over an area about 600 metres by 400 metres which includes the locations of the diamond drilling sites. Anomalous values of copper up to 1920 ppm are reported. Evaluation of results is continuing. Further results will be reported when received. (SEE GCNL NO.160, 20Aug97, P.5 FOR PREVIOUS DOBBIN PROJECT INFORMATION)
