News Release

DEC 9 187 S.W.
Mr Stirling McIlveen reports:

The Huntington-Lacana drilling program on Huntington's Brett claims continues to yield encouraging results.

HOLE	INTERSECTION	OZ AU/TON	WIDTH (FEET)
87-45	216.5-221.5	0.169	5.0
	226.4-232.9	0.125	6.5
87-46	93.4-124.7	0.085	31.3
	93.4- 98.1	0.119	4.7
	105.0-119.8	0.107	14.8
	138.0-189.0	0.074	51.0
	170.9-186.0	0.111	15.1
	259.2-279.0	0.133	19.8
87-47	221.1-226.7	0.110	5.6
	245.1-248.1	0.980	3.0

The intersections in DDH 87-45 were found to extend up to 40 feet from the main shear zone. The values in 87-46 were found approximately 15-20 feet from the same mineralized structure and extend over a vertical range of approximately 175 feet.

It would appear that both the lateral and vertical range of gold values associated with this structure are considerable.

Drill hole 87-47 intersected the area between discovery holes 87-29 and 87-30 and confirmed the continuity of the mineralized structure along with the same high gold values. Compilation of the assay and geological data is currently underway and will formulate the basis of a more detailed exploration program for 1988.

Recent surface work on the property has revealed the presence of another mineralized zone approximately 1300 feet east of the recent drilling. Exploration work has outlined highly anomalous gold values in soil and rock samples over a length of approximately 1000 feet. The orientation of these values and the local geology suggest the presence of parallel mineralized zone similar to that currently under examination. An exploration program for 1988 will test this target in more detail.

News Release

NOV 11/87
Mr Stirling McIlveen reports:

Drilling on the Brett claims has encountered additional mineralization. The latest results are from DDH 87-42 located 965 feet south of the Discovery holes, DDH 87-29 and DDH 87-30.

HOLE	INTERSECTION	GOLD (ft)	WIDTH OZ/T (ft)
87-42	256.7 - 265.7	.991*	9.0

* Includes 4.75 ft grading 1.81 oz/ton gold.

This intersection together with previous intersections from earlier drill holes is associated with a steeply dipping mineralized shear structure that has been traced over 1900 ft. It is situated on another section 425 ft lower than the high grade intersection reported in hole DDH 87-29.

Drilling is continuing along the shear structure and further results will be made available following analysis by representatives of both Huntington and Lacana.

HUNTINGTON RESOURCES INC. (HUN-V)

DRILL RESULTS CONTINUE - The Huntington Resources - TO BE ENCOURAGING Lacana Mining Corp. diamond ~~82LSW/10~~ drill program on Huntington's Brett claims 25 km west of Vernon, B.C. continues to yield encouraging results. These assays were generated in the area of the discovery holes, DDH 87-29 and DDH 87-30 (GCNL 201(87) P.2 and 218(87)p.1 refer). Relative to the discovery holes, Holes 87-45,-46 and -47 are 250 feet to the south, 220 feet to the south and on section, respectively.

DEC 9 187 # 236

DRILL HOLE	INTERVAL FT.	FOOTAGE	OZ.GOLD/T
DDH 87-45	216.5-221.5	5.0	0.169
	226.4-232.9	6.5	.125

ANOTHER SIGNIFICANT HOLE - Drilling on the Brett claims DRILLED ON GOLD CLAIMS 25 km west of Vernon, B.C., ~~82LSW/10~~ has encountered additional mineralization. Stirling D. McIlveen, president of Huntington Resources Inc., says the latest results are from DDH 87-42 located 965 feet south of the discovery holes, DDH 87-29 and DDH 87-30.

This intersection, together with intersections in earlier drill holes, is associated with a steeply dipping mineralized shear structure traced over a length of 1900 feet. It is significant that this intersection is situated on section 425 feet lower than the high grade intersection reported in discovery hole DDH 87-29. (See GCNL 201(87) P.2 for results of Holes 87-29 through 37 and for detail of interests Lacana Mining Corp. can earn by funding work on this project.)

Mr. McIlveen says drilling is continuing along the shear structure. Further results will be made available following analysis by representatives of both Huntington and Lacana.

Huntington Resources Ltd HUN
Shares issued: 2,020,000 Oct 14 close: \$0.80
News Release

Mr Stirling McIlveen reports: *S.W.*

Exploration on the Brett claims by Huntington and Lacana Mining Corporation continues to yield favourable results. Based upon current results Lacana has confirmed its intention to extend its support for additional drilling beyond its 1987 commitment. *Oct 16/87*

Since the announcement of the discovery hole (DDH 87-29) drilling has continued along what is referred to as the main shear zone. To date, this structure has been tested along a strike length of 1900 feet and to depths ranging from 100 to 350 feet. Assay results confirm that gold mineralization extends up to 50 feet deep and occasionally deeper into the footwall of the shear zone. *82LSW110*

One recently completed drill section (DDH 87-36 and 37), located 250 feet south of the discovery hole, encountered several zones of gold mineralization extending up to 80 feet into the footwall area. Drill intersections ranging from 125 feet to 350 feet below surface. Both holes were drilled to test the down dip extension of trench values (0.104 oz/ton of gold across 16 feet) developed earlier. Significant assay results to date are as follows:

NOV 23/87 Huntington pulls good drill hole *N.H.*

VANCOUVER — Another good hole has been reported from Huntington Resources' Brett claims, 15 miles west of Vernon, B.C. Hole No 87-42 returned 9 ft of 0.99 oz gold including 4.75 ft of 1.8 oz.

The gold is associated with a steeply-dipping mineralized shear structure that has been traced for approximately 1,900 ft. Of significance is the fact that the latest intersection occurs on a different section and some 425 ft lower than the high grade intercept reported earlier in hole 87-29. That hole included a 17.2-ft intercept averaging 0.74 oz gold. *82LSW110*

High grade gold values reported by Huntington

VANCOUVER — Some high grade gold values have been reported by Huntington Resources from its Brett property near Vernon, B.C. The prospect falls under a joint venture agreement with Lacana Mining which can earn a 51% interest for an expenditure of \$500,000.

The best results were returned from hole 87-29 where visible gold was observed in drill core. These results included 17.2 ft of 0.74 oz gold (which included 5.25 ft of 2.3 oz gold) and 7.1 ft of 0.27 oz.

The depth continuity of the shear zone and vein structure were determined last year by Huntington in a 2,600-ft drill program. This structure is now being explored in 30-50-m slices and 18 holes have been completed so far. *X.M.*

Final assays are still pending from a hole drilled 200 ft below the high grade discovery but preliminary results indicate significant gold values over similar widths, says the company. Drilling is continuing to the south and the program could last for several weeks yet. *9/1/87*

According to Werner Gruenwald, a consulting geologist and company director, values have been found in wall rock extending a considerable distance from the shear

structure. The average width of the zone appears to be about 6 ft but it does widen to 30-40 ft in places. The area's gold potential has been almost totally overlooked although exploration was conducted for porphyry copper and molybdenum in the 1960s and '70s. However, ground around the joint venture property has all been staked, he confirms. *82LSW110*

He feels there could be some bulk tonnage potential and notes the structure has been located over a vertical distance of 500 ft, adding it's still open ended. The gold occurs in its native form, as electrum, and there is also some argentite, a silver sulphide. The sulphide content ranges from 1%-5% and the gold-bearing material is quite clean with no lead, arsenic or appreciable amounts of mercury.

Placer mining was done in the area at the turn of the century and he believes the property could be the source of the gold-bearing alluvial gravels. The vein system is epithermal in nature and he suggests it's analogous to the Blackdome mine 160 miles north of Vancouver. Lacana optioned the property in May and Huntington will be operator during the first two years of the agreement.

GOLD 172 HUNTINGTON RESOURCES INC. (HUN-V) Sept 9/87

GOLD ASSAY REPORTED - The Huntington Resources

82LSW110 Inc./Lacana Mining Corp. Joint venture has encountered high grade gold intersections during the current drilling program on the Brett property near Vernon, B.C. A total of 4600 feet of drilling has been completed. Drilling is concentrated on the southern extension of the Main Shear zone. This structure has been traced over a length of 1700 feet and remains open along strike to the south and to depth. The most significant results have come from DDH 87-29 in which visible gold was observed. This is also the most southerly drill hole to date. The zones intersected are highlighted as follows:

INTERSECTION FT.	WIDTH	GRADE (OZ/TON GOLD)
137.8-155.0	17.2	0.737
(Includes	5.25	2.29
170.9-178.0	7.1	0.274

These values along with other anomalous values have been found over much greater widths than were encountered in the 1986 program.

Preliminary assays for 87-30, drilled beneath DDH 87-29 indicated significant gold values over similar widths and 200 feet lower in elevation. Drilling is to continue to the south of this area.

#201 HUNTINGTON RESOURCES INC. (HUN-V)

LACANA TO FUND CONTINUED DRILLING - Huntington has

82LSW110

confirmed drilling will continue beyond the \$250,000 committed for 1987 on the Brett claims, located along the Whiteman River, 20 miles southwest of Vernon, B.C. To date drilling has tested the Main zone along a 1,900 foot strike length, over widths from 2 to 25 feet and to depth of 100 to 350 feet below surface. The drilling has confirmed the gold extends into the footwall of the gold bearing shear zone for as much as 50 feet. (SEE DETAIL ASSAY RESULTS IN THE TABLE OVERLEAF.) *GCH*

One recently completed drill section, drill hole No. 87-36 and 87-37, located 250 feet south of the discovery hole, encountered several zones of gold mineralization extending up to 80 feet into the footwall area. Drill intersections ranged from 125 to 350 feet below surface. Both holes were drilled to test the down dip extension of trench values of 0.104 oz.gold/ton across 16 feet.

82LSW110

News Release

Mr Stirling McIlveen reports:

SW

Drilling of the Brett claims near Vernon, B.C. has encountered additional gold mineralization. The latest results are from DDH 87-30 and are between 100 and 200 feet vertically below those in DDH 87-29.

9/16/87

The results from both holes are summarized as follows:

Hole	Intersection (feet)	Au (oz/ton)	Width (feet)
DDH87-29	137.8-155	0.737	17.2
dip: 48	170.9-178	0.274	7.1
DDH87-30	263.0-273	0.144	10.0
dip: 74	296-301.5	0.127	5.5
	311.9-329	0.092	17.1

The gold values in DDH 87-30 from 296 to 329 feet are associated with a flat lying tuff horizon that is a minimum of 60 feet thick. This tuff horizon is considered a favourable host to gold mineralization adjacent to the Main shear zone (as demonstrated by recent mineralization).

Current drill will continue to test this, and other favourable targets to the south. Additional results will be announced as they become available.

GCH

HUNTINGTON RESOURCES INC. (HUN-V)

9/17/87

HOLE	DIP	INTERVAL, FT.	FOOTAGE	OZ.GOLD/T
87-29	48d	137.8 - 155.0	17.2	0.737
		170.9 - 178.0	7.1	0.274
87-30	74d	263.0 - 273.0	10.0	0.144
		296.0 - 301.5	5.5	0.127
		311.9 - 329.0	17.1	0.092

MORE GOOD GOLD VALUES CUT - Diamond drilling on the IN DRILLING NEAR VERNON Brett claims near Vernon,

82LSW110 B.C., has encountered additional gold mineralization. The latest results are from DDH 87-30 and are between 100 and 200 feet vertically below those in DDH 87-29.

#179

The gold values in DDH 87-30 from 296 to 329 feet are associated with a flat lying tuff horizon at least 60 feet thick. This tuff is considered a favorable host to gold mineralization adjacent to the Main Shear zone. Current drilling will continue to test this and other favorable targets to the south.

GCH166 HUNTINGTON RESOURCES INC. (HUN-V) *AUG 29/86*

ENCOURAGING GOLD - Stirling D. McIlveen, president,

ASSAYS REPORTED reports that Huntington Resources

82LSW110(4E) Inc. has just completed a 2600-foot diamond drilling program on the Brett property near Vernon, B.C. to test epithermal gold-silver mineralization discovered in association with shear zones, veins, and feldspar porphyry dikes in Tertiary volcanic rocks last year. Assay results from 12 holes are printed overleaf page 2. They include 15 feet grading 0.265 oz.gold/ton in Hole 86-15 and 11 feet grading 0.175 oz.gold/t in Hole 86-16.

Mr. McIlveen says surface work and drilling indicate these volcanic rocks consist primarily of andesitic and basaltic flows intercalated with several pyroclastic horizons ranging from 10 to more than 50 feet thick. In addition to the shear and vein zones, mineralization extends well into the permeable pyroclastic horizons as well as altered and silicified andesites. To date, the drilling has outlined the mineralized shear and vein system over at least 350 feet on strike and to a depth of more than 250 feet. The potential for delineating additional strike length and depth is excellent.

About 1 km to the east is a much larger epithermal structure, a gossan zone, in a similar geological environment. This zone has excellent economic potential, so, management propose to test it also in the second phase drill program.

News Release

Mr Stirling McIlveen reports:

SW

The Huntington Resources/Lacana Mining Corp. joint venture has encountered high grade gold intersections during the current drilling program on the Brett property near Vernon, B.C. To date a total of 4600 feet of drilling has been completed. Drilling is concentrated on the southern extension of the Main Shear zone. This structure has been traced over a length of 1700 feet and remains open along strike to the south and to depth. 82LSW110

The most significant results have come from DDH 87-29 in which visible gold was observed. This is also the most southerly drill hole to date. The zones intersected are as follows:

Intersection (feet)	Width (feet)	Au (oz/ton)
137.8-155.0	17.2	0.737
(includes 5.25' at 2.29 oz/ton)		
170.9-178.0	7.1	0.274

These values along with other anomalous values have been found over much greater widths than were encountered in the 1986 program. Preliminary assays for 87-30, drilled beneath DDH 87-29 indicate significant gold values over similar widths and 200 feet lower in elevation. Drilling is to continue to the south of this area. Results will be announced as they become available.

Brett 82LSW110

GCNL #91 10 MAY 1984 82L/ME; 92T
HUNTINGTON RESOURCES INC., president Stirling D. McIlveen states in the report for the period from incorporation 824
11Apr83 to 31Jan84, that the company acquired 3 mineral properties in B.C., being the 2 contiguous 30-unit Brett 82E
claims, on the north side of Whiteman Creek, about 13 km west of Okanagan Lake and 25 km west of Vernon; the Kam claims
in Osoyoos mining division and the Paul, Jean and Bob claims in Nicola mining division. The greatest potential of 3
areas of interest on the Brett claims is a prominent gossan zone containing significant gold values and possibly 82E
hosting a large tonnage low grade gold deposit. The heavy mineral sampling results were consistent with the presence
of a yet undiscovered lode of gold toward the western side of the Brett claims. Gold and silver values occur in two
narrow quartz veins on the Brett property and indications are there is at least one more vein occurring above the two
known occurrences. Huntington propose to start development of the Brett claims in late May and anticipate completion
of Phase I by mid-July.

Preliminary indications suggest further exploration is warranted on the Kam claims. Huntington propose to hold
the Paul, Jean and Bob claims in inventory awaiting a copper price recovery. Huntington had a working capital of
\$31,652 at 31Jan84 when 1,047,999 shares were outstanding.

GCNL #133 11 JULY 1985 82LSW110
HUNTINGTON RESOURCES INC. (HUN-V) 82L/BE
WORK STARTS ON GOLD/SILVER - Stirling D. McIlveen, president of Huntington Resources Inc., has reported that the first
PROPERTY NEAR VERNON, B.C. phase of the summer work program, consisting of detailed "fill-in" soil and rock
sampling, encountered encouraging anomalous gold and silver values in both bedrock and
quartz vein float over a length of 350 meters. The property is about 21 miles west of Vernon, B.C. Quartz vein float
assaying as high as 1.58 oz. of gold and 1.4 oz. silver/t. has been encountered. The zone appears open at both ends.
Construction on the drill access road began on June 17. The road is intended to cut through this zone as well as
the other anomalous zones. This preliminary work will greatly assist in pinpointing likely drill targets.

GCNL 120 JUNE 23/87

HUNTINGTON RESOURCES INC. (HUN-V)

DRILL TEST IS STARTING - A diamond drill is now on the
ON CLAIMS NEAR VERNON Brett 1 and 2 claims of
82L003 82L/3 Huntington Resources Inc., a
gold prospect near the Whiteman River some 20 miles WSW
of Vernon, B.C., financed by Lacana Mining Corp. under
an option agreement. First drill results are expected
in mid-July. Lacana is to spend at least \$250,000 this
year. By spending a further \$250,000 in 1988, Lacana
may elect to enter a joint venture agreement with Hunt-
ington on a 51% Lacana - 49% Huntington basis. Lacana
is to pay Huntington \$50,000 cash in 1987 and \$60,000 in
1988 and to buy \$100,000 worth of Huntington shares when
the joint venture is formed. In addition, Lacana has
been granted an option to buy 100,000 Huntington shares
per year for 5 years following the joint venture at
prices to be established.

Lacana will receive nothing for its 1987 expendi-
ture of \$250,000. If Lacana spends \$500,000 on the
property but does not enter a joint venture it will
retain 10% net profit interest in the claims. Lacana
has also agreed to use its best efforts to assist
Huntington in raising capital. Subject to a 90-day
grace period, Huntington may be diluted at a rate of 10%
for every \$350,000 spent on the property by Lacana if
Huntington does not provide its portion of the funding.
