January 25, 1974.

Dr. W.J. McMillan
Geologist, Geological Division
Mineral Resources Branch
Victoria, B. C.

Dear Dr. McMillan:

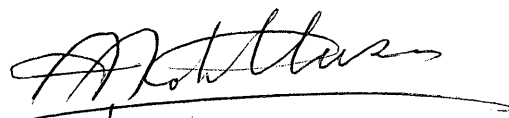

Please accept my apology for the delay in my answer to your request letter dated December 11th. At that time, I had not logged the cores of the Sheba drilling.

I have now completed the drill logs, so am sending you the following data.

1. Summary report, Sheba project 1973.
2. Map of the Sheba property.

I hope it will be of some interest to you.

Yours sincerely,

A. Komura
Chief Geologist

SHEBA PROJECT 1974

THE DOWA MINING CO., LTD.

Vancouver Office

A. Komura
Chief Geologist

July 19, 1974

GENERAL

During the period from May 26th, 1974, to June 19th, 1974, three diamond drill holes were completed on the Sheba property for an aggregate of 2,088 feet. Field supervision of the Coates Enterprises Ltd. was done by A. Komura, chief geologist of the Dowa Mining Co., Ltd. The results of the drilling is shown on the drill logs accompanying this report.

A base camp was located at the same place where it was set up in 1973, and all core boxes were collected there.

DIAMOND DRILLING

Three diamond drill holes were completed for an aggregate of 2,088 feet. Core size was B.Q and N.Q. wireline contracted from the Coates Enterprises Ltd. The locations of these holes are shown on the map accompanying this report. Table 1 gives the particulars on these holes.

Table 1

<u>Hole No.</u>	<u>Claims</u>	<u>Elevation</u>	<u>Direction</u>	<u>Angle</u>	<u>Depth</u>	<u>Drilling Intervals</u>
S-74-1	LYNN 7FR	4,650'	E	-60°	698'	May 30-June 3, 1974
S-74-2	J-6	4,840'	E	-60°	688'	June 6-June 9, 1974
S-74-3	J-4	4,920'	E	-60°	702'	June 12-June 18, 1974
Total Footage					2,088'	

All these holes were planned for following the mineralized zone shown in S-71-11 drill hole.

S-74-1

Overburden depth 110 feet
Rock type Bethlehem Quartz diorite

Alteration Propylitic alteration consisting of chlorite argillite, green sericite in the first half, potash feldspar and argillite alteration in the later half.

Mineralization very weak chalcopyrite, bornite, molybdenite.

Fault Shear zone from 341 feet to 423 feet, from 462 feet to 546 feet, from 567 feet to 641 feet.

S-74-2

Overburden 20 feet

Rock type Pink porphyrite from 20 feet to 193 feet, after that Bethlehem quartz diorite.

Alteration Epidote alteration in the pink porphyrite, generally weak potash feldspar alteration in the Bethlehem quartz diorite.

Mineralization generally weak copper mineralization, specially moderate from 510 feet to 640 feet. Assay result is as follows - 510 feet to 640 feet, 130 feet section 0.11% Cu., 0.02% Mo.

Fault Shear zone from 135 feet to 140 feet, from 159 feet to 168 feet, from 173 feet to 208 feet, from 228 feet to 230 feet, from 373 feet to 376 feet, from 498 feet to 500 feet.

S-74-3

Overburden 10 feet

Rock type Bathsaida quartz monzonite from 10 feet to 476 feet, after that Bethlehem quartz diorite.

Alteration	Potash feldspar alteration in the first half, propylite alteration in the later half.
Mineralization	very very weak, occasionally chalcopyrite disseminated and veinlets.
Fault	from 235 feet to 241 feet, from 273 feet to 275 feet.

CONCLUSION

Examination of this area did not indicate any good economical target. Dow conducted an honest appraisal of the Sheba claims during the duration of its option. No major concentrations of copper or molybdenum were found in the areas studied.
