Katie - An Innovative Treatment of Copper-Gold Tailings at the Mountain View Superfund Site in Colorado
(2003-2004)

At Mountain View, a Superfund Site, 100,000 tons of copper-gold tailings are being treated with a proprietary process to recover copper and gold. The process is designed to reduce the volume of tailings and recover valuable metals.

The Katie Project is a demonstration of a new tailings treatment technology. The process involves the use of a proprietary reagent to leach copper and gold from the tailings. The recovered metals are then sold, and the remaining tailings are stabilized for long-term storage. This process significantly reduces the volume of tailings and recovers valuable resources.
