Memorandum To File

KS Exp

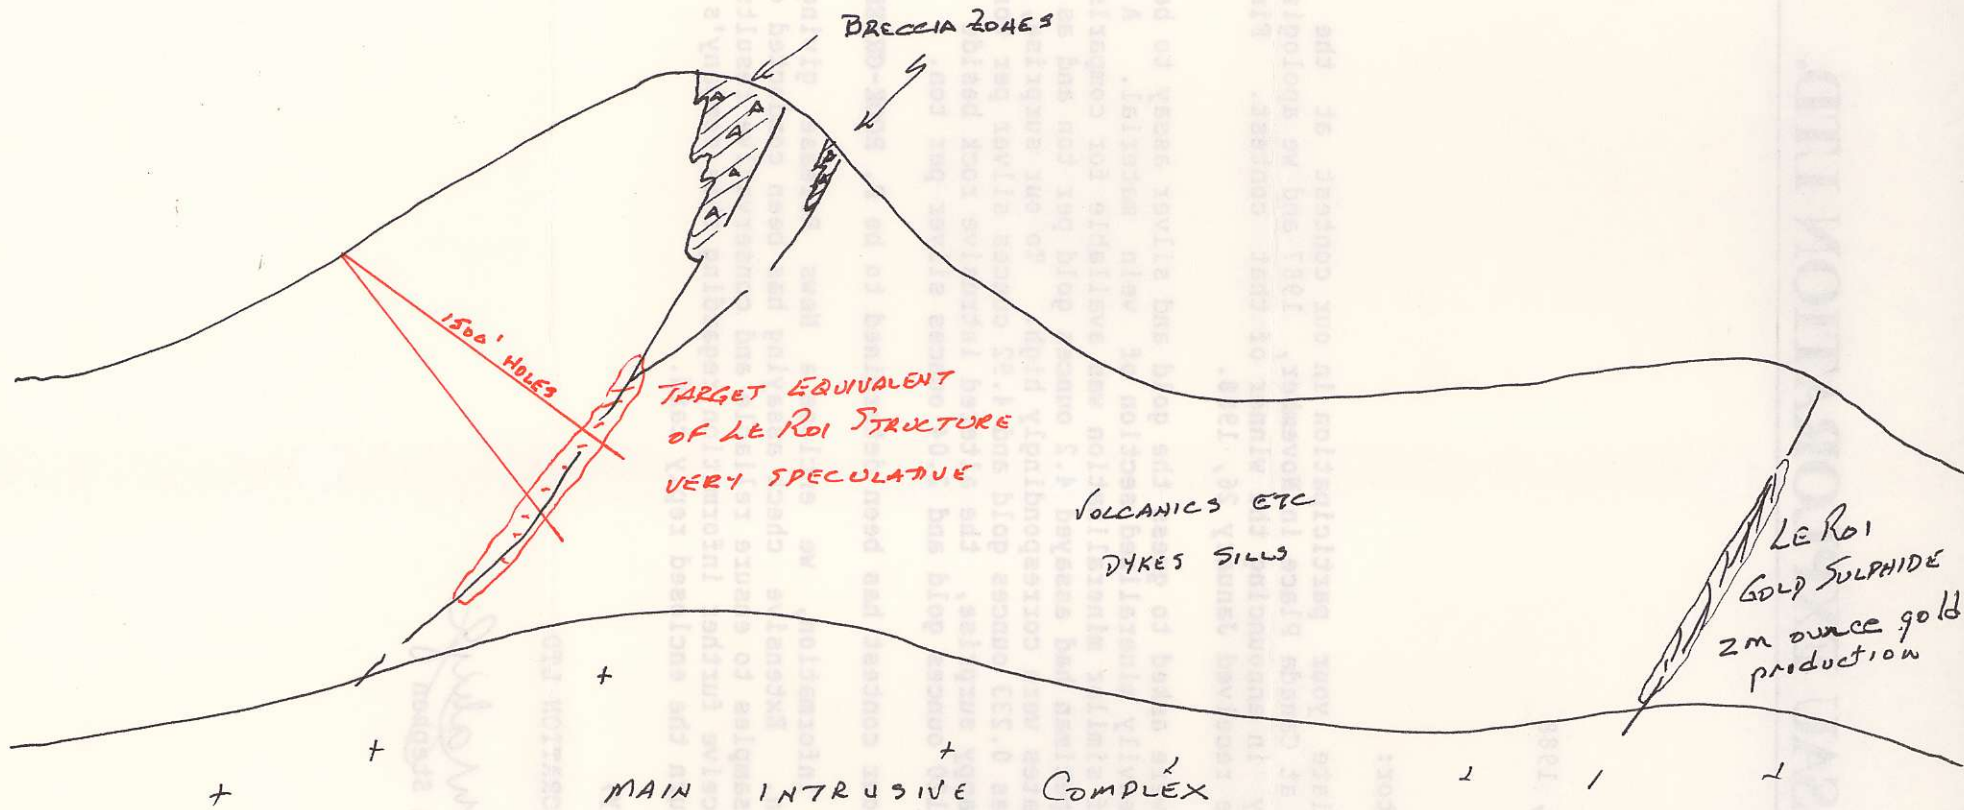

lunch with Roy Beeson.

Discussion of Comins - Freeport McMoran S.V. at Rossland. Large package ground north of west extension of Le Roi mined structure which has been explored by adits. Ground in SW surrounds a small block of Teck ground but includes molybdenum open pits to the north.

Two main breccia zones contain mineralization but pinch out at depth. Trend of breccias and ~~post~~ possibly MoS₂ pits, after some adjust ment for faulting would parallel the Le Roi structure.

Target for long (1500-2000' holes) would be postulated fault vein feeder roots to breccia zones at horizon equivalent to Le Roi within volcanics above underlying main intrusion.
