Dear Brian;

I am writing to thank you and Rex Pegg for the excellent tour we had on July 13 of your J & L project.

I thought there might be some strong similarities between the J & L and our Rea Gold prospect. However after the visit the only similarity that remains is the presence of arsenopyrite. We were most impressed with the tremendous continuity of the zone along strike and the metal zoning. Although in places the sulphides appeared very veinlike I must agree with your syngenetic theory & remobilization. Some of the textures of the sulphides in the limestones reminded me of similar textures I saw at the Reeves Macdonald Pb-Zn deposit south of Salmo and to a lesser extent at the Bluebell deposit at Riondel on the east side of Kootenay Lake.

Congratulations on your success last year and best wishes for even better success with this year's program. Thank you once again for an extremely interesting and informative visit.

Yours truly,

A. J. Davidson
Senior Exploration Geologist

AJD/ik

PS Call me whenever you wish to set up a Rea Gold visit.
