Major Copper-Gold Discovery in the Stewart Gold Camp, British Columbia

The Directors of Sulphurets Gold Corporation are pleased to announce significant results from diamond drilling of its 25% owned Kerr Gold Project. In the past four years, exploration has included over 5383 meters (17,660 feet) of core drilling in 39 holes. This drilling has outlined an extensive area of copper-gold mineralization, the B Zone, which would be amenable to bulk mining techniques.

The Kerr Property is located in the Stewart Gold Camp of northwestern British Columbia. Drilling completed in 1988 has concentrated on two areas, the A and the B Zones.

The B Zone contains high-grade copper and associated gold mineralization hosted by an altered and sheared group of tuffaceous volcanic rocks. This zone has over one kilometer of strike length, up to 300 meters width and a depth of at least 300 meters. It is open along strike and to depth.

Important results from B Zone drilling include:

Hole	From		To		Length		Copper %	Gold oz/ton
	meters	meters	meters	feet	meters	feet		
K88-1	176.2	272.8	96.6	317	0.99	0.010		
K88-11	51.0	212.8	161.8	530	1.03	0.009		
including	51.0	163.9	112.9	370	1.32	0.012		
K87-5	10.3	52.4	42.1	138	0.54	0.014		
	142.0	224.0	81.0	266	0.61	0.009		
K87-8	28.4	115.1	86.7	285	1.10	0.011		

The A zone hosts gold-silver-copper mineralization peripheral to B Zone copper-gold mineralization. Important assay results from 1988 drilling of the A Zone include:

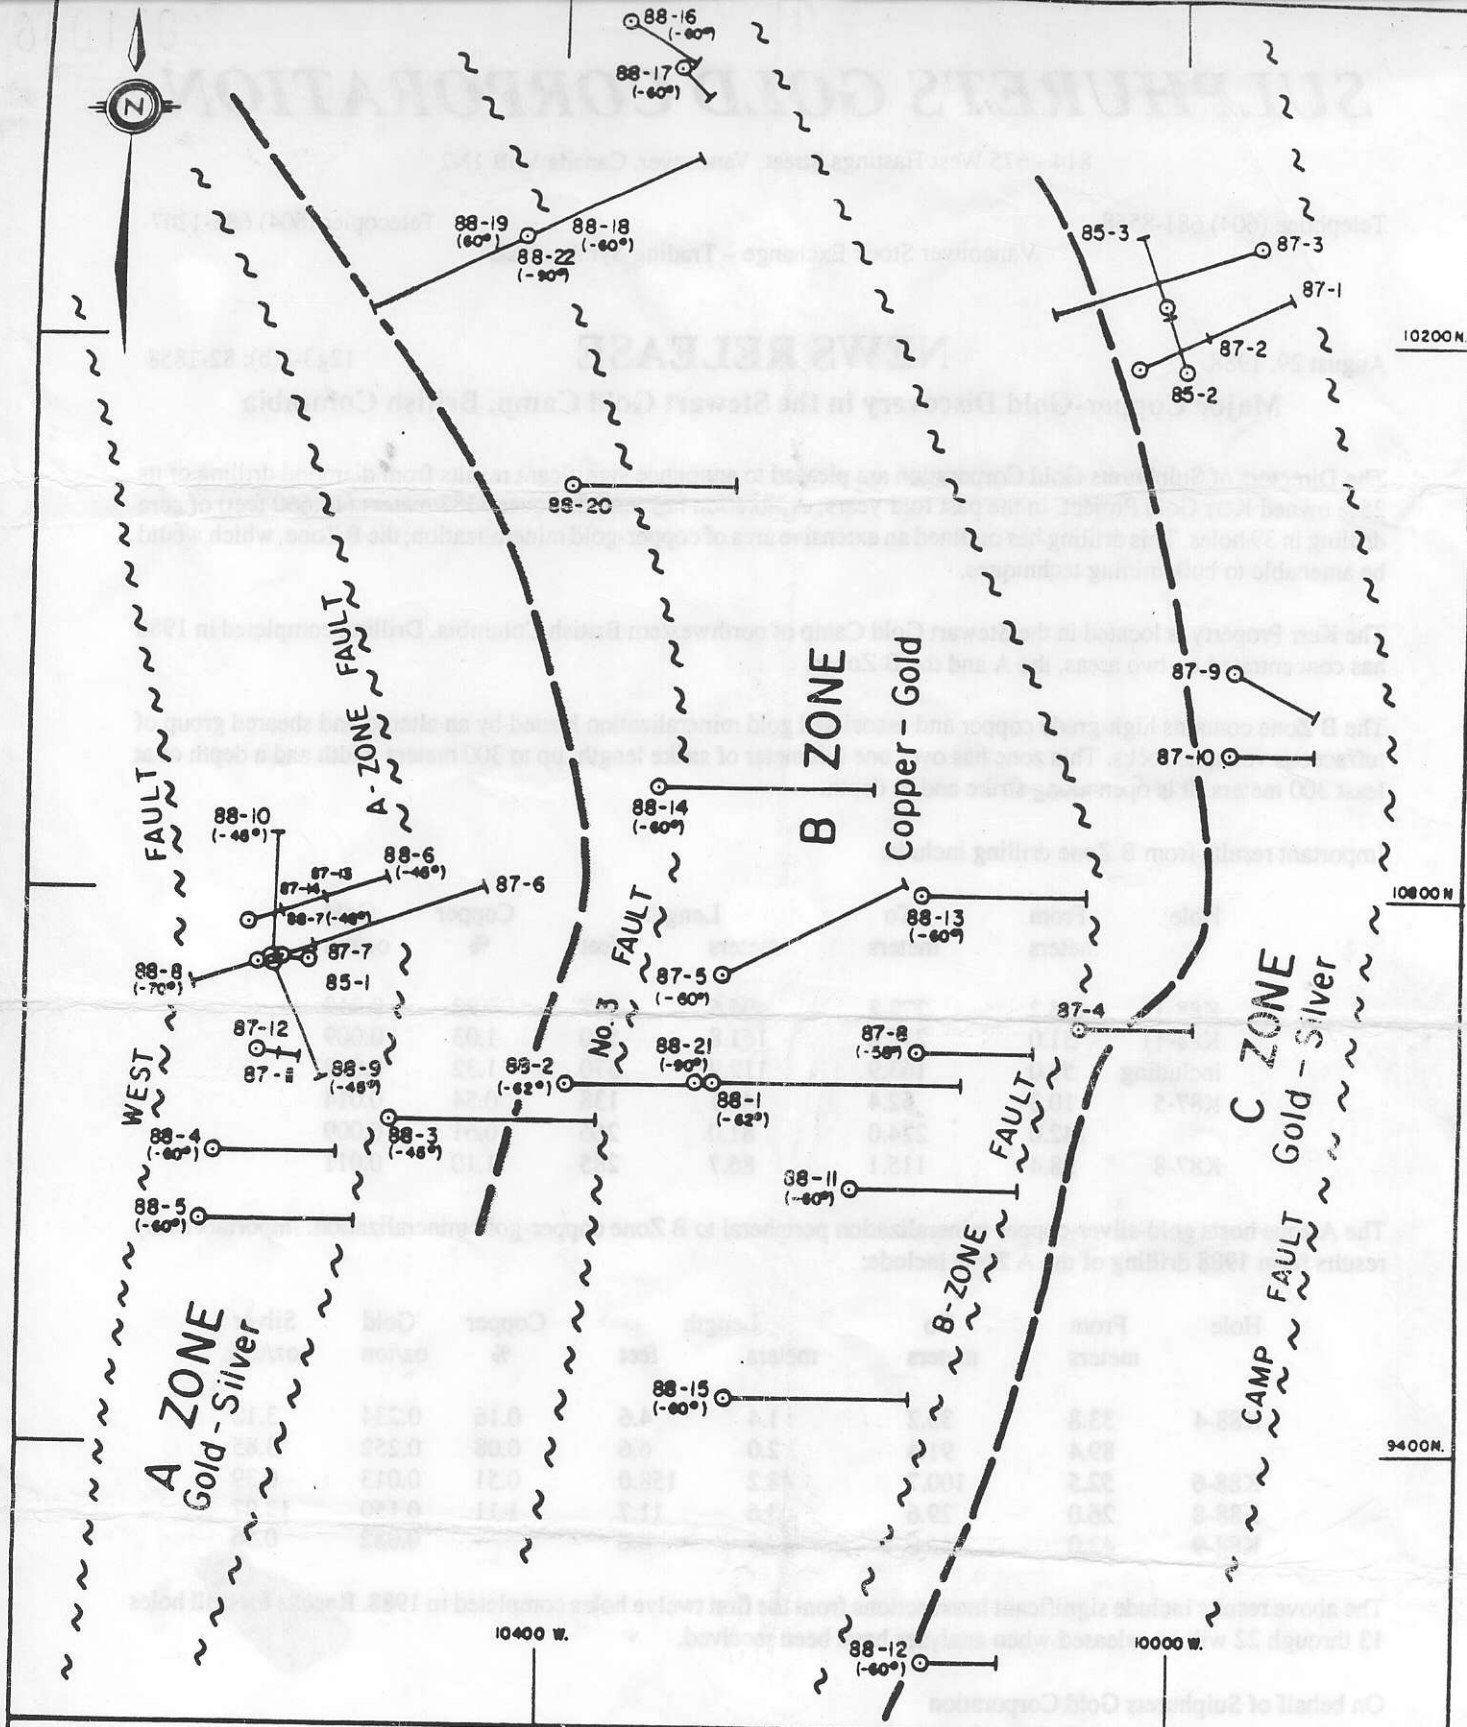

Hole	From		To		Length		Copper %	Gold oz/ton	Silver oz/ton
	meters	meters	meters	feet	meters	feet			
K88-4	33.8	35.2	1.4	4.6	0.16	0.234	3.12		
	89.4	91.4	2.0	6.6	0.08	0.252	3.85		
K88-6	52.5	100.7	48.2	158.0	0.51	0.013	0.39		
K88-8	26.0	29.6	3.6	11.7	1.11	0.150	13.07		
K88-9	43.0	45.0	2.0	6.6	-	0.082	0.56		

The above results include significant intersections from the first twelve holes completed in 1988. Results for drill holes 13 through 22 will be released when analyses have been received.
