

Summary of July 20: Sattahine Regional.

JH-20

Fromy and I reached starting point before 8:30 am. We took a sample and sidehilled, at roughly equal contours, all the way across the North-west face of our mountain. Taking soil samples every 300 meters. The rock we encountered was extremely dead but we managed to find 3 hand-specs. to give an idea of the better float or talus drifting around. We took 15 samples from JH-469 to JH-483.
