Geological Survey Branch
Release Notification 2001-6
April 24, 2001*

Release Date: May 24 at 1:30 pm

NEW Geochemical Data - Quesnel (NTS 93B) BC RGS 54

Price: \$50.00 - hardcopy \$10.00 - digital data package

New analytical data for gold and 25 other metals in stream sediments will be published and released on May 24th, 2001. This previously unavailable INAA data plus original field and analytical results has been compiled into hardcopy and digital data packages. Conducted in 1980, the Quesnel (NTS 93B) reconnaissance-scale stream sediment and water survey included a total of 757 sediment samples and 750 water samples collected from 715 sites over a 14 000 square kilometre area.

TIME: May 24, 2001 at 1:30 p.m.

Release Date: June 1 at 12:00 pm

Stream Sediment and Water Geochemistry of the Ecstall Greenstone Belt Open File 2001-13 Price \$25.00

Results of a new stream sediment and water survey conducted over the Ecstall Greenstone Belt between the Skeena River and Douglas Channel (parts of NTS 103H and I) will be released June 1st, 2001. Samples were collected from 228 sites covering over 1800 square kilometres. Sediment samples were analysed by INAA and ICP for base and precious metals, pathfinder and rare earth elements. Water samples were analysed for pH, uranium, fluoride and sulphate. This belt has high potential for the discovery of new VMS mineralization

TIME: June 1, 2001 at 12:00 p.m.

Stream Sediment and Water Geochemistry of the Ecstall Greenstone Belt

NTS 103H/103I

Wayne Jackaman

Open File 2001-13

Release Date: June 1/01 Noon

INTRODUCTION

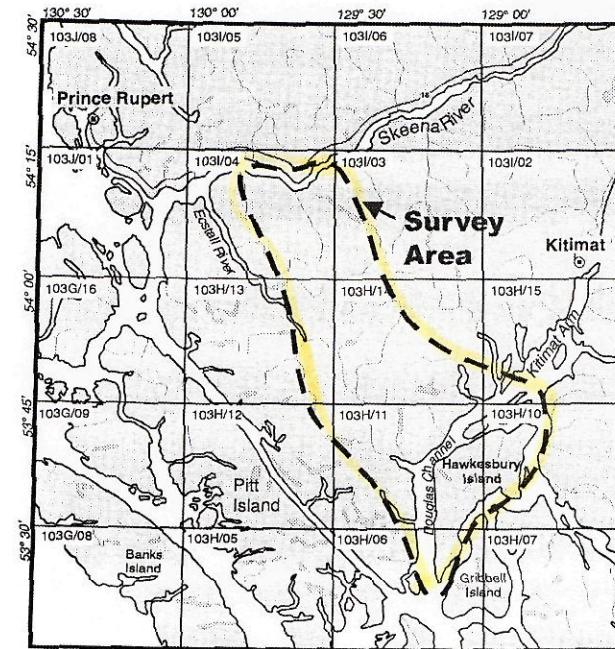

Open File 2001-13 presents new field and analytical data from a reconnaissance-scale stream sediment and water geochemical survey (Figure 1) conducted by the British Columbia Geological Survey Branch in the Ecstall Greenstone Belt during 2000. Results for over 48 different metals in stream sediments and pH, uranium, fluoride and sulphate in stream waters are included in this report. The survey covers parts of eight 1:50,000 NTS map sheets in the Douglas Channel (NTS 103H) and the Terrace (NTS 103I) areas. A total of 228 sites were sampled over a combined area of approximately 1800 square kilometres at an average density of 1 site per 7 square kilometres. Details on the geology and mineral potential of the Ecstall Greenstone Belt are described by Alldrick (2001).

Sample collection, preparation and analytical procedures conform to standards established by the National Geochemical Reconnaissance (NGR) as described by Ballantyne (1991). Analytical results and field observations compiled by the RGS program in British Columbia are used in the development of a high-quality geochemical database suitable for mineral exploration, resource assessment, geological mapping and environmental studies. Funded under the government's Corporate Resource Inventory Initiative (CRII), this survey is part of the Ministry of Energy and Mines' contribution to the North Coast Land Resource Planning process.

REPORT FORMAT

This report is divided into the following sections:

- Introduction and survey methodology.
- Listings of field observations and analytical data (Appendix A).
- Summary statistics (Appendix B).
- Sample location, geology and element maps (Appendix C).
- Analytical and field data are included on diskette in comma-delimited format.

Fluoride was determined by ion selective electrode (ION). A 20 millilitre aliquot of the sample was mixed with 20 millilitres of TISAB II (total ionic strength adjustment buffer) buffer solution. Fluoride was determined with an Orion fluoride electrode in conjunction with a Corning ion meter.

Sulphate was determined by a turbidimetric method (TURB). A 50 millilitre aliquot was mixed with barium chloride and an isopropyl alcohol-HCl-NaCl reagent, and turbidity of the resulting barium sulphate solution measured with a spectrophotometer at 420 nanometres.

PRELIMINARY DATA INTERPRETATION

The following data interpretation is of a preliminary nature only and should not be considered exhaustive. Discussions on the distribution and abundance of copper, lead, zinc, silver and gold are intended to highlight geochemical anomalies that may be of interest to mineral explorationists targeting VMS mineralization as described by Höy (1995). The geology and mineral deposits of the Ecstall Greenstone Belt mentioned in this open file are described in detail by Alldrick (2001).

The Ecstall Belt currently hosts a total of 36 sulphide mineral occurrences (Map 2). Developed prospects Scotia (MINFILE 103I 007), Ecstall (MINFILE 103H 011) and Packsack (MINFILE 103H 013) are the main sulphide deposits located in the belt and have combined reserves of 10,818,539 tonnes grading 0.5% Cu, 0.05% Pb, 2.1% Zn, 20.8 g/T Ag and 0.4 g/T Au.

Table 2. Geochemical signature for sediment samples collected downstream of known mineral occurrences.

MINFILE Name	Map	ID	Rep	Cu (ppm)		Pb (ppm)		Zn (ppm)		Ag (ppb)		Au (ppb)	
				ICP	ICP	ICP	ICP	ICP	ICP	ICP	ICP	ICP	ICP
Ecstall	103H13	9106	10	125.99	14.07	139.8	304	10					
Ecstall	103H13	9107	20	125.00	11.30	158.1	240	7					
Strike	103H11	9145	00	74.96	11.88	88.7	99	5					
Horsefly	103H14	9150	00	70.88	6.61	69.0	102	92					
Ravine	103H14	9174	00	54.31	6.00	104.4	141	2					
Steelhead	103H11	9179	00	90.71	3.98	117.2	167	22					
Scotia	103I04	9038	00	21.33	9.57	80.1	48	2					

The geochemical signature for sediment samples collected downstream from a selection of known mineral occurrences are listed in Table 2. For comparison, summary statistics for the total Ecstall Belt data set and the total RGS data set for copper, lead, zinc, silver and gold in stream sediments are provided in Table 3.

Results show that the samples collected downstream of known occurrences are anomalous in one or more of the listed metals relative to the Ecstall data set and in some cases the total RGS database. Samples 9106/07 collected downstream of the Ecstall deposit are characterized by enhanced concentrations (greater than the 98th percentile) for copper, lead, zinc and silver. Downstream from the Strike occurrence, sample 9145 lists a lead value greater than the 98th percentile and copper and zinc values above the 90th percentile. Sample 9150, collected below the Horsefly (MINFILE 103H 014) showing produced the survey's highest gold value of 92 ppb.

Table 3. Summary statistics for total Ecstall Belt stream sediment data set and the total provincial RGS data set.

Table 4 provides the mean and median concentrations calculated for samples underlain by the various stratified and igneous rocks found in the Ecstall Belt (Alldrick, 2001). As expected, element concentrations for samples underlain by the Ecstall Batholith (KEG), Big Falls Tonalite (DBO) and the Johnston Lake-Foch Lake Tonalite (JFO) are generally lower for the listed metals. Samples underlain by metavolcanic rocks of the Big Falls Igneous Complex (PV), layered gneiss (PN) and metasedimentary rocks of the Big Falls Igneous Complex (PQ) tend to have higher concentrations.
